Key words: Cambodia, Laos, flora, Orchidaceae, plant diversity.

Summary. Herbarium material collected in 2013–2015 in Cambodia and Laos provides 298 new localities for 167 orchid species (from 57 genera). Almost all reported locations are new on the territory of studied countries. These data provide substantial basis for understanding of present day distribution of rare species needed protection. Among reported species, 8 species are new for the flora of Cambodia (*Bulbophyllum macranthum*, *B. orientale*, *B. physocoryphum*, *B. retusiusculum*, *Dendrobium pachyphyllum*, *Eria tenuiflora*, *Pholidota recurva*, *Thelasis pygmaea*) and 43 species are new for the flora of Laos (*Bulbophyllum ambrosia*, *B. andersonii*, *B. bicolor*, *B. bisetoides*, *B. delitescens*, *B. depressum*, *B. forrestii*, *B. lilacinum*, *B. longibrachiatum*, *B. psychoon*, *Calanthe alismifolia*, *C. sylvatica*, *Cheirostylis pusilla*, *Cleisostoma melanorachis*, *C. subulatum*, *C. williamsonii*, *Coelogyne eberhardtii*, *C. leucantha*, *C. ovalis*, *Dendrobium eriiflorum*, *D. falconeri*, *D. trantuanii*, *D. williamsonii*, *Didymoplexis pallens*, *Epigeneium fuscescens*, *Eria apertiflora*, *E. bambusifolia*, *E. pachyphylla*, *Flickingeria fimbriata*, *Gastrochilus suavis*, *Liparis mannii*, *L. sootenzanensis*, *Luisia ramosii*, *Oberonia kwangsiensis*, *O. maxima*, *Pelatantheria insectifera*, *Phalaenopsis braceana*, *Pholidota yunnanensis*, *Schoenorchis scolopendria*, *S. tixieri*, *Tainia cordifolia*, *Thrixspermum calceolum*). Five species (*Dendrobium minusculum*, *Oberonia simplex*, *Porpax capuccinorum*, *P. laosensis* and *Taeniophyllum filiferum*) discovered in Cambodia in Laos are described as new for science. One genus (*Didymoplexis*) was found in Laos at first. Such rare ornamental species as *Aerides falcata*, *A. flabellata*, *A. rosea*, *Arundina caespitosa*, *Ascolabium pusillum*, *Bulbophyllum bicolor*, *Calanthe cardioglossa*, *Coelogyne assamica*, *C. calcicola*, *C. eberhardtii*, *C. flaccida*, *C. trinervis*, *Dendrobium aphyllum*, *D. christyanum*, *D. chryseum*, *D. chrysotoxum*, *D. crepidatum*, *D. dixanthum*, *D. falconeri*, *D. fimbriatum*, *D. findleyanum*, *D. gratiosissimum*, *D. jenkinsii*, *D. loddigesii*, *D. nobile*, *D. senile*, *D. thrysiflorum*, *D. trantuanii*, *D. trigonopus*, *D. williamsonii*, *Doritis pulcherrima*, *Gastrochilus suavis*, *Holcoglossum kimbalianum*, *H. subulifolium*, *Hygrochilus parishii*, *Paphiopedilum concolor*, *P. dianthum*, *Phalaenopsis braceana*, *Schoenorchis scolopendria*, *S. tixieri*, *Spathoglottis affinis*, *Tainia cordifolia*, *Vanda brunnea*, *V. denisoniana*, *V. flavobrunnea* become presently very rare on the territory of studied local floras and badly need protection to prevent their extinction in nature.

Новые и редкие виды орхидных во флоре Камбоджи и Лаоса

Аннотация. Гербарные сборы 2013–2015 годов документируют 298 новых находений 167 видов орхидных (из 57 родов) в Камбодже и Лаосе. Почти все приведенные местонахождения являются новыми для территорий изученных стран. Эти данные существенно расширяют современные знания о распространении редких растений, нуждающихся в охране. Среди приводимых видов 8 являются новыми для флоры Камбоджи (*Bulbophyllum macranthum*, *B. orientale*, *B. physocoryphum*, *B. retusiusculum*, *Dendrobium pachyphyllum*, *Eria tenuiflora*, *Pholidota recurva*, *Thelasis pygmaea*) и 43 – новые для флоры Лаоса (*Bulbophyllum ambrosia*, *B. andersonii*, *B. bicolor*, *B. bisetoides*, *B. delitescens*, *B. depressum*, *B. forrestii*, *B. lilacinum*, *B. longibrachiatum*, *B. psyhoon*, *Calanthe alismifolia*, *C. sylvatica*, *Cheirostylis pusilla*, *Cleisostoma melanorachis*, *C. subulatum*, *C. williamsonii*, *Coelogyne eberhardtii*, *C. leucantha*, *C. ovalis*, *Dendrobium eriiflorum*, *D. falconeri*, *D. trantuanii*, *D. williamsonii*, *Didymoplexis pallens*, *Epigeneium fuscescens*, *Eria apertiflora*, *E. bambusifolia*, *E. pachyphyllea*, *Flickingeria fimbriata*, *Gastrochilus suavis*, *Liparis mannii*, *L. sootenzanensis*, *Luisia ramosii*, *Oberonia kwangsiensis*, *O. maxima*, *Pelatantheria insectifera*, *Phalaenopsis braceana*, *Pholidota yunnanensis*, *Schoenorchis scolopendria*, *S. tixieri*, *Tainia cordifolia*, *Thrixspermum calceolum*). Пять видов (*Dendrobium minusculum*, *Oberonia simplex*, *Porpax capuccinorum*, *P. laosensis* и *Taeniophyllum filiferum*) из Камбоджи и Лаоса описаны в качестве новых для науки. Один род (*Didymoplexis*) приводится для Лаоса впервые. Такие декоративные виды, как *Aerides falcata*, *A. flabellata*, *A. rosea*, *Arundina caespitosa*, *Ascolabium pusillum*, *Bulbophyllum bicolor*, *Calanthe cardioglossa*, *Coelogyne assamica*, *C. calcicola*, *C. eberhardtii*, *C. flaccida*, *C. trinervis*, *Dendrobium aphyllum*, *D. christyanum*, *D. chryseum*, *D. chrysotoxum*, *D. crepidatum*, *D. dixanthum*, *D. falconeri*, *D. fimbriatum*, *D. findleyanum*, *D. gratusissimum*, *D. jenkinsii*, *D. loddigesii*, *D. nobile*, *D. senile*, *D. thyrsiflorum*, *D. trantuanii*, *D. trigonopus*, *D. williamsonii*, *Doritis pulcherrima*, *Gastrochilus suavis*, *Holcoglossum kimballianum*, *H. subulifolium*, *Hygrochilus parishii*, *Paphiopedilum concolor*, *P. dianthum*, *Phalaenopsis braceana*, *Schoenorchis scolopendria*, *S. tixieri*, *Spathoglottis affinis*, *Tainia cordifolia*, *Vanda brunnea*, *V. denisoniana*, *V. flavobrunnea* в настоящее время на территории изученных локальных флор становятся очень редкими и крайне нуждаются в охране для предотвращения их полного вымирания в природе.

Introduction

The orchid flora of Cambodia and Laos still remains one of the less studied orchid floras in Tropical Asia. In comparison to other countries of Indochina Peninsula, such as Thailand or Vietnam each including at least 1100 species (Seidenfaden, 1992; Averyanov, 2003; Pedersen et al., 2011), about 200 orchid species totally were recorded for Cambodia (Seidenfaden, 1992; Averyanov, 2013; Leti et al., 2013; Schuiteman et al., 2015, 2016; Tagane et al., 2015) and about 530 species for Laos (Newman et al., 2007; Schuiteman et al., 2008; Averyanov, 2013). Meanwhile, according to their

square and various natural conditions all countries of Indochina should certainly conceal similar orchid richness and diversity. Present paper summarizes some consequent steps in studies of the orchid flora of Cambodia and Laos based on herbarium specimens collected by different collectors in the field mainly during 2013–2015.

The paper provides 298 new localities for 167 species (from 57 genera) among which 8 species are new for the flora of Cambodia and 43 species represent new records for Laos. One genus – *Didymoplexis* is recorded for the Laotian flora at first. Mentioned new records (see table 1) represent sig-

Table 1
New records of orchids in the flora of Cambodia and Laos

Names of new species for science and species new for the flora are marked with bold font (additionally, new species for science are marked with asterisk “*”, new species for Cambodia and Laos are marked with superscript letters “^C” and “^L” respectively)

<i>Acampe rigida</i>	<i>Cleisostoma arietinum</i>	D. trantuanii	<i>Odontochilus tortus</i>

<i>Callostylis rigida</i>	<i>D. senile</i>	<i>O. mucronata</i>	<i>V. flavobrunnea</i>
L Cheirostylis pusilla	<i>D. thrysiflorum</i>	*O. simplex	

nificant addition to our previous knowledge (Gagnepain, Guillaumin, 1932–1934; Vidal, 1959; Seidenfaden, 1966, 1973, 1975; Schuiteman, Vogel, 2000; Callaghan, 2004; Svengsuksa, Lamxay, 2005) summarized in last accounts of Cambodian (Seidenfaden, 1992) and Laotian floras (Newman et al., 2007; Schuiteman et al., 2008). Five species – *Den-*

drobium minusculum Aver., *Oberonia simplex* Aver., *Porpax capuccinorum* Aver., *P. laosensis* Aver. and *Taeniophyllum filiferum* Aver. discovered in Cambodia and Laos are described as new for science.

The annotated list of all discovered species is presented below. Paragraphs for species are arranged in the list according to species name in

alphabetic order. The annotation for each species includes following data in separate lines:

- valid name and main synonyms, occurring in regional literature;
- maximally abbreviated and unified text of herbarium labels including geographical locality, collection date, collectors' names, collection number and acronym of Herbarium where mentioned specimen is housed;
- living form, summarized available data on ecology, habitat elevation, phenology and observed rarity;
- general distribution and distribution in studied countries (by listing of the country provinces).

Color and line illustrations as well as taxonomic notes are additionally provided for new and most significant species. The names of orchid species and genera reported for Cambodia and Laos at first are marked in the list with superscript letters “^C” and “^L” respectively, and species described as a new for science are marked with asterisk “*”.

The following Herbarium acronyms are used in the text:

CPC – Herbarium of the Center for Plant Conservation, Vietnam Union of Science and Technology Associations, Hanoi, Vietnam.

LE – Herbarium of Komarov Botanical Institute, Russian Academy of Sciences, St. Petersburg, Russian Federation.

HNL – Conseil National des Sciences, National Herbarium of Laos, Vientiane, Lao PDR.

FOF – Herbarium of National University of Laos, Vientiane, Lao PDR.

Prefixes “CPC” and “LA-VN” at some collecting numbers represent abbreviations of “The Center for Plant Conservation” (CPC) and “Laos – Vietnamese expedition” (LA-VN). Both collecting series are attributed to herbaria collected in expeditions managed by the Center for Plant Conservation (Vietnam Union of Science and Technology Associations) with main collectors – Leonid V. Averyanov and Nguyen Tien Hiep. Prefixes “K” and “TM” at plant collecting numbers designate herbarium collections of Eugene L. Konstantinov and Tatiana V. Maisak with their co-workers.

Attractive species highly desirable for cultivation are indicated in the list as “ornamental”. Almost all these species fast become very rare due to commercial collecting even on protected areas and badly need conservation to prevent their full extinction in nature.

New and rare orchids in the flora of Cambodia and Laos

Acampe Lindl.

A. rigida (J. E. Smith) P. F. Hunt,

1970, Kew Bull. 24, 1: 98; Newman et al., 2007, Checklist Vasc. Pl. Lao PDR: 251; Schuit. et al., 2008, Nord. Journ. Bot. 26: 262; Aver., 2013, Turczaninowia 16, 4: 28.

Northeastern Laos, Houaphan province, Viengxay district, Vieng Xai village, 7 April 2015. N. T. Hiep, L. Averyanov, N. S. Khang et al., LA-VN 1144 (HNL, FOF, LE). Northeastern Laos, Houaphan province, Viengxay district, Xieng Luong village, 8 April 2015, N. T. Hiep, L. Averyanov, N. S. Khang et al., LA-VN 1163 (HNL, FOF, LE).

Epiphyte and lithophyte. Primary and secondary broad-leaved evergreen forests on limestone, often on exposed cliffs near hilltops, 200–950 m. Fl. September – November. One of the commonest species in observed limestone areas.

Southern and east Africa, Sri Lanka, India, Myanmar, China, Thailand, Cambodia, Vietnam, Peninsular Malaysia. Laos: Attapu, Bolikhambai, Champasak, Houaphan, Khammouan, Louangphrabang, Phongsali, Savannakhet, Vientiane, Xaignabouri.

Aerides Lour.

A. falcata Lindl. et Paxton,

1851, Fl. Gard. 2: 142; Newman et al., 2007, Checklist Vasc. Pl. Lao PDR: 252; Schuit. et al., 2008, Nord. Journ. Bot. 26: 263.

Northeastern Laos, Houaphan province, Hem district, Nacoc village, 12 April 2015, N. T. Hiep, L. Averyanov, N. S. Khang et al., LA-VN 1433 (HNL, FOF, LE).

Epiphyte. Primary and secondary broad-leaved evergreen open forests on any kind of soil, 170–1200 m. Fl. March – June. Locally common. Ornamental.

NE. India, Myanmar, Thailand, Cambodia, Vietnam. Laos: Bolikhambai, Champasak, Houaphan, Khammouan, Louangphrabang, Xaisomboun.

A. flabellata Downie,

1925, Bull. Misc. Inform. Kew 1925(9): 387;

Newman et al., 2007, Checklist Vasc. Pl. Lao PDR: 252; Schuit. et al., 2008, Nord. Journ. Bot. 26: 314.

≡ *Vanda flabellata* (Downie) Christenson, 1985, Indian Orchid Journ. 1, 4: 156.

Northeastern Laos, Houaphan province, Hem district, Nacoc village, 12 April 2015, *N. T. Hiep, L. Averyanov, N. S. Khang et al.*, LA-VN 1419 (HNL, FOF, LE).

Epiphyte. Primary and secondary broad-leaved evergreen and deciduous open dry forests on any kind of soil, often in dipterocarp forests or forests on limestone, (500)1000–1200 m. Fl. April – May. Not common. Ornamental.

SW. China, Thailand, Vietnam. Laos: Bokeo, Bolikhamsai, Houaphan, Louang Namtha, Louangphrabang.

A. rosea Paxton,

1851, Fl. Gard. 2: 109; Schuit. et al., 2008, Nord. Journ. Bot. 26: 263; Aver., 2013, Turczaninowia 16, 4: 28.

Northeastern Laos, Houaphan province, Xon district, Nong Hua Pa Noi village, 11 April 2015, *N. T. Hiep, L. Averyanov, N. S. Khang et al.*, LA-VN 1235 (HNL, FOF, LE). Northeastern Laos, Houaphan province, Hem district, Na Puok village, 11 April 2015, *N. T. Hiep, L. Averyanov, N. S. Khang et al.*, LA-VN 1322 (HNL, FOF, LE).

Epiphyte and occasionally lithophyte. Primary and secondary broad-leaved evergreen forests on rocky limestone, 500–1200 m. Fl. March – May. Locally common. Ornamental.

NE. India, Bhutan, Myanmar, S. China, Thailand, Vietnam. Laos: Houaphan, Louangphrabang, Vientiane.

Appendicula Blume

A. hexandra (J. Koenig) J. J. Sm., 1932, Bull. Jard. Bot. Buitenzorg 3, 12: 119; Aver., 2013, Turczaninowia 16, 4: 28.

Southern Cambodia, Kampot province, Phnom Bokor National park, 1 December 2014, *E. Konstantinov, K-365* (LE).

Epiphyte and occasionally lithophyte. Cloud evergreen forests on mountain tops, usually along rocky streams. 900–1000 m. Fl. May – July. Occasional.

Thailand, Vietnam, Sumatra. Cambodia: Kampot.

Arachnis Blume

A. labrosa (Lindl. et Paxton) Rchb. f., 1886, Bot. Centralbl. 28: 343; Newman et al., 2007, Checklist Vasc. Pl. Lao PDR: 253; Schuit. et al., 2008, Nord. Journ. Bot. 26: 265; Aver., 2013, Turczaninowia 16, 4: 28.

= *Renanthera bilinguis* Rchb. f., 1854, Xenia Orchid. 1: 7.

≡ *Renanthera labrosa* (Lindl. et Paxton) Rchb. f., 1855, Xenia Orchid. 1: 88.

≡ *Armodorum labrosum* (Lindl. et Paxton) Schltr., 1911, Repert. Spec. Nov. Regni Veg. 10: 197.

Northeastern Laos, Houaphan province, Hem district, Nacoc village, 12 April 2015, *N. T. Hiep, L. Averyanov, N. S. Khang et al.*, LA-VN 1463 (HNL, FOF, LE). Northeastern Laos, Houaphan province, Viengxay district, Vieng Xai village, 7 April 2015, *N. T. Hiep, L. Averyanov, N. S. Khang et al.*, LA-VN 1107 (HNL, FOF, LE).

Epiphyte. Primary and secondary broad-leaved evergreen and deciduous open dry forests on any kind of soil, often in dipterocarp forests or on forests on limestone, 150–1500 m. Fl. July – August. Locally common.

NE. India, Bhutan, Myanmar, S. China, Ryukyu Is., Thailand, Vietnam. Laos: Attapu, Champasak, Houaphan, Saravan, Vientiane.

Arundina Blume

A. caespitosa Aver.,

2007, Taiwania 52: 289; Schuit. et al., 2008, Nord. Journ. Bot. 26: 265.

Fig. 1A.

Central Laos, Vientiane province, Phou Khao Khouay National Protected Area to about 40 km NE of Vientiane, 9 December 2015, *L. Averyanov, T. Maisak, AL 159a* (LE – photo).

Lithophyte. Primary and secondary dry evergreen forests along rocky stream, commonly of wet sandstone rocks, rarely on sandy wet soil in deciduous dipterocarp forests, 300–800 m. Fl. August – December. Locally common. Ornamental.

Vietnam. Laos: Bolikhamsai, Khammouan, Vientiane.

This rare species almost extinct in Vietnam but remains still common fairly in some observed areas in central Laos (Phou Khao Khouay National Protected Area).

Ascolabium S. S. Ying

A. pusillum (Aver.) Aver.,

1994, Identification Guide. Viet. Orch.: 397; Schuit. et al., 2008, Nord. Journ. Bot. 26: 265.

≡ *Ascocentropsis pusilla* (Aver.) Senghas et Schildh., 2000, Orchideenfr. 7: 290; Newman et al., 2007, Checklist Vasc. Pl. Lao PDR: 253.

≡ *Ascocentrum pusillum* Aver., 1988, Bot. Journ. (Moscow & Leningrad) 73: 104.

Southwestern Laos, Champasak province, Pakse district, Bolaven plateau, along road Paksong – Ban Houay Kong, 26 November 2015, *E. Konstantinov, T. Vongsa, K-389* (LE).

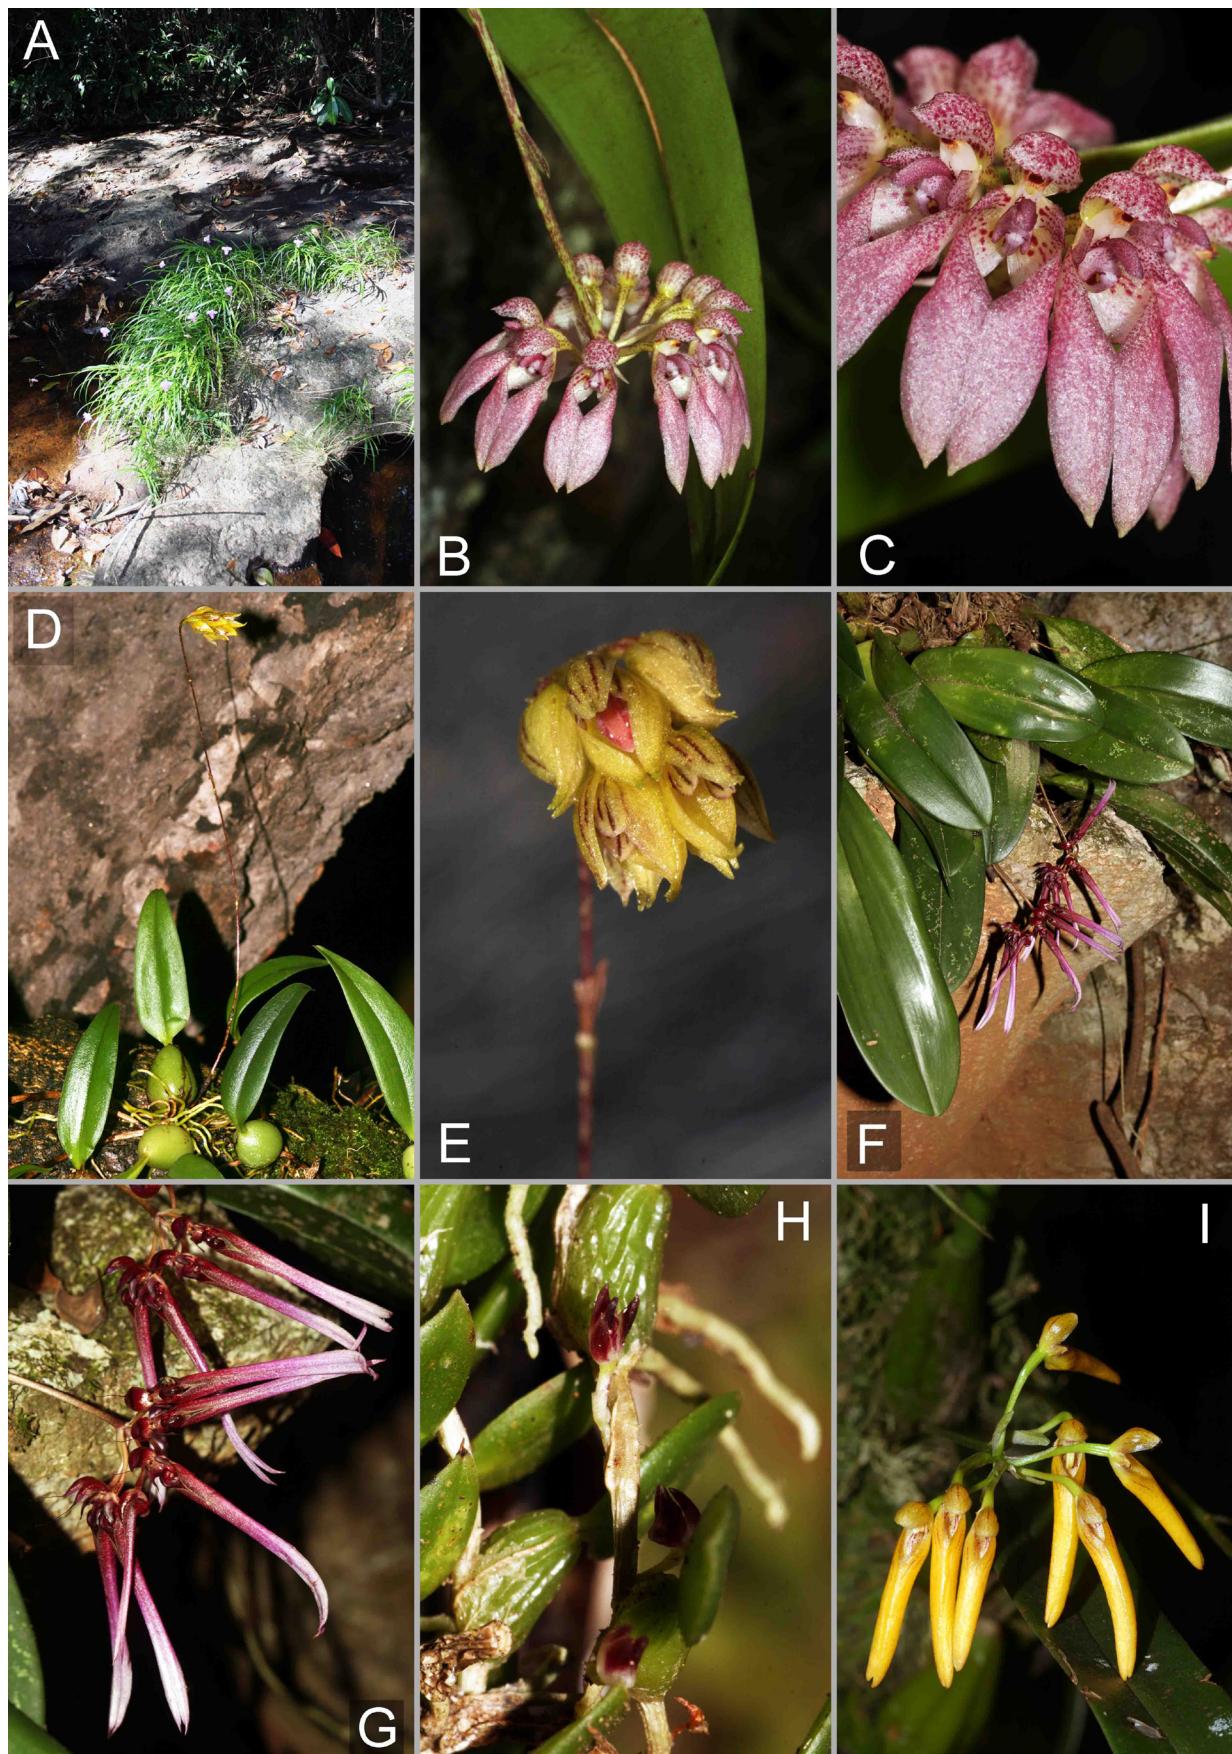

Fig. 1. New and rare orchids in the flora of Cambodia and Laos. A – *Arundina caespitosa* Aver. (AL 159a). B, C – *B. andersonii* (Hook. f.) J. J. Sm. (LA-VN 1184a). D, E – *Bulbophyllum bisetoides* Seidenf. (LA-VN 514). F, G – *B. delitescens* Hance (LA-VN 954). H – *B. depressum* King et Pantl. (LA-VN 1157). I – *B. forrestii* Seidenf. (LA-VN 516). Photos by L. Averyanov.

Epiphyte. Primary and old secondary evergreen and deciduous open forests, 800–1200 m. Fl. November – December. Rare. Ornamental.

Thailand, Vietnam. Laos: Bolikhamsai, Champasak.

Rare endemic of eastern Indochina standing in Vietnam on the verge of full extinction.

Biermannia King et Pantl.

B. calcarata Aver.,

1988, Bot. Journ. (Moscow & Leningrad) 73: 429; Schuit. et al., 2008, Nord. Journ. Bot. 26: 265.

Central Laos, Xiangkhouang province, Peak district, Khoang village, 3 April 2015, N. T. Hiep, L. Averyanov, N. S. Khang et al., LA-VN 972 (HNL, FOF, LE).

Canopy epiphyte. Primary and secondary broad-leaved evergreen humid forests on any kind of soil, commonly along stream valleys, 900–1450 m. Fl. May – June. Rare.

Vietnam. Laos: Phongsali, Xiangkhouang.

Plants from Laos may be different from the type originated from northern Vietnam (Schuiteman et al., 2008).

Bulbophyllum Thouars

B. affine Lindl.,

1830, Gen. Sp. Orch. Pl.: 48; Newman et al., 2007, Checklist Vasc. Pl. Lao PDR: 254; Schuit. et al., 2008, Nord. Journ. Bot. 26: 266; Aver., 2013, Turczaninowia 16, 4: 29.

Northeastern Laos, Houaphan province, Viengxay district, Xieng Luong village, 8 April 2015, N. T. Hiep, L. Averyanov, N. S. Khang et al., LA-VN 1184 (HNL, FOF, LE).

Primary and secondary broad-leaved evergreen and deciduous dry forests on any kind of soil, 600–1500 m. Fl. May – August.

NE. India, Nepal, Bhutan, China, Ryukyu Islands, Thailand, Vietnam, Cambodia. Laos: Bolikhamsai, Houaphan, Khammouan, Louang Namtha, Phongsali, Saravan, Vientiane.

It is “one of the most frequent epiphytic orchids in northern Laos” (Schuiteman et al., 2008).

L. B. ambrosia Schltr.,

1919, Repert. Spec. Nov. Regni Veg. Beih. 4: 247.

Described from northeastern Laos (“Xiangkhouang province, Peak district, Oran village, primary and secondary broad-leaved evergreen dry forest on shale sandstone slopes and along ridge edge at elevation 1750–1850 m a.s.l., clustering epiphyte on tall tree, rare”). **Type** (“2 April 2015, N. T. Hiep, L. Averyanov, N. S. Khang,

N. Q. Hieu, T. Maisak, Pheng Phengsintham, LA-VN 925”) – LE (holotype), HNL, FOF (isotypes).

Epitype – d-EXSICCATES OF VIETNAMESE FLORA 0253/LA-VN 925.

Fig. 5; 6 (d-EXSICCATES OF VIETNAMESE FLORA 0253/LA-VN 925).

Species epithet refers minuscule plant habit.

Perennial clustering sympodial miniature epiphytic herb. Rhizome very short, negligible. Stems densely clustering, pseudobulbous, erect, with (2)3–4(5) nodes, globose to ovoid and narrowly ovoid, (0.4)0.5–1.5(2) cm tall, (2.5)3–4(5) mm in diam., with (1)2–3(4) leaves, young stems glossy green, enveloped by white to light greenish hyaline leaf sheaths, old finely rough, dark green to brown, naked or with light brownish scarious sheath remains at nodes. Leaves, distichous, sessile, sheathed; sheath tubular, as long as internode, completely disintegrating or remaining in form of insignificant scarious, papyraceous remnants on second-year stems; leaf blade conduplicate, with prominent median vein, suberect or recurved, rather thin, herbaceous, oblong lanceolate, (0.6)1–2(2.2) cm long, (2)3–5(5.5) mm wide, obtuse, sometime shortly unequally bilobulate at apex. Inflorescence 1–2, synanthous, arising from the apical part of young leafy stem, suberect, lax, many flowered raceme (1)1.5–5(6) cm tall; scape and rachis light green, straight, scape short (4)5–10(12) mm long, naked or with 1–2 small sterile bracts. Scape bracts and floral bracts, light greenish, narrowly triangular, straight, conduplicate, tapering and acute at apex, (1.5)2–4(4.5) mm long, (0.5)0.8–1(1.2) mm wide. Pedicel and ovary light green, glabrous, (1)1.2–1.6(1.8) mm long, bent down at apex; pedicel cylindric, ovary obconoid, slightly longitudinally grooved. Flowers nodding, not much widely opening, light greenish, lip apical half light green, (3.2)3.5–4.5(5) mm across. Sepals spreading, narrowly ovate to broadly lanceolate, obtuse, (2.8)3–3.4(3.6) mm long, (0.7)0.8–1(1.2) mm wide, lateral sepals at the base oblique broadening to 1.8–2 mm wide, forming short broad saccate mentum 0.8–1 mm long, 1.2–1.5 mm wide. Petals spreading, oblong broadly lanceolate, obtuse, little shorter and narrower than sepals. Lip more or less movable, entire, narrowly ovate, (2.2)2.4–2.6(2.8) mm long, (1)1.2–1.4(1.6) mm wide, fleshy, glabrous, recurved, blunt to round at apex, with 2 low simple fleshy keels running from the lip base to the epichile. Column light green, very short, erect, stout, shortly cylindric, 0.5–0.6 mm tall, 0.8–1 mm wide, at front with prominent wing-like purple stelidia 0.6–0.8 mm tall, exceeding

operculum; stigma large, sub-circular, concave; rostellum in form of small, thin, truncate plate; column foot twice longer than the column proper, thick, concave, shortly cymbiform, 1.2–1.4 mm long, 0.8–1 mm wide, forward curved. Anther cap light yellow, simple, conical hemispheric, smooth, 0.3–0.4 mm tall and wide, at front with broad truncate beak. Pollinia 4, lens-shaped, in two pair, yellow, oblong ovoid, 0.2–0.25 mm long.

Miniature branch and trunk epiphyte. Primary montane evergreen, broad-leaved forests on shaly sandstone, 1750–1850 m. Fl. August – September. Rare.

Laos: Xiangkhouang. Endemic.

Morphologically new species is most close to *Dendrobium caespitosum* King et Pantl., *D. mucronatum* Seidenf. and *D. porphyrochilum* Lindl., from which differs in smaller uniform pale green flowers

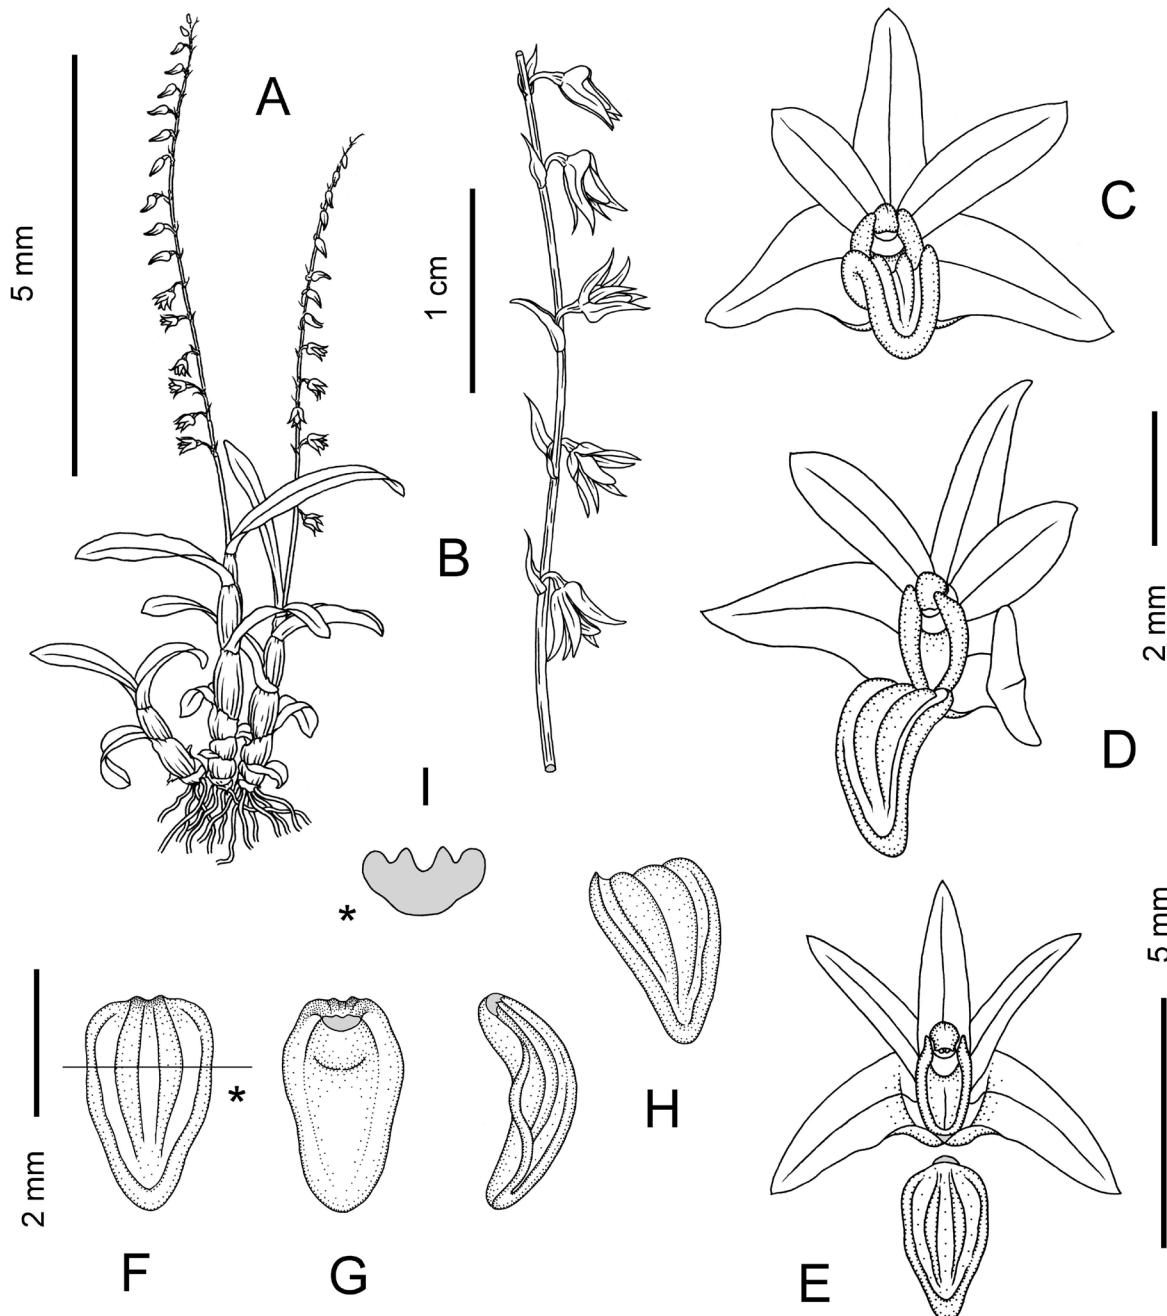

Fig. 5. New and rare orchids in the flora of Cambodia and Laos. *Dendrobium minusculum* Aver. A – Flowering plant. B – Portion of inflorescence. C, D – Flower, half side view. ***O. simplex* Aver., sp. nov.**

Described from southern Cambodia (“Kampot province, Phnom Bokor national park, 10°37.923N, 104°01.143E, epiphyte in cloud short forest along small stream at elevation about 1000 m a.s.l.”). **Type** (“16 December 2014, *E. Konstantinov K-369*) – LE (holotype).

Fig. 9; 10D, E.

Species epithet refers simple, unlobed, rectangular-ligulate flower lip.

Perennial sympodial epiphytic miniature herb 1–2(2.5) cm tall. Stem abbreviate, very short, 1.5–2(3) mm long, completely covered by (3)4–6(7) imbricate leaves, with many thin, flexuose, dull yellowish gray roots at the base. Leaves distichous, fleshy, with more or less distinct articulation at the base, lanceolate, slightly oblique, triangular obtuse at apex, (0.6)1–1.8(2.2) cm long, (1.2)1.5–2.2(2.6) mm wide. Inflorescence subterminal, arching to almost straight raceme, (1.5)2–4(4.5) cm long, 2–3 mm in diam.; scape stout, erect, straight or slightly arching, (0.4)0.6–1.5(2) cm long, covered by many spirally arranged, overlapping, narrowly lanceolate to almost filiform aristate sterile bracts 1.5–2 mm long; rachis arching to almost straight, more or less

rigid, finely longitudinally ribbed, (0.8)1–2(2.5) cm long, 0.4–0.5 mm in diam. Floral bracts in basal part of raceme narrowly triangular, (0.8)1–1.2(1.4) mm, 0.2–0.3 mm wide, to the apex broadly ovate triangular, concave, (0.5)0.6–0.8(1) mm long by 0.5–0.7 mm, shortly acuminate, incise irregularly denticulate along the margin, during anthesis more or less recurved. Pedicel and ovary 0.4–0.5 mm long; pedicel shortly cylindric 0.2–0.25 mm long, about 0.1 mm in diam.; ovary narrowly obovoid, 0.2–0.25 mm long, 0.2–0.3 mm broad; developing ovary and ripening fruit obovoid, (0.5)1–1.2 mm long, 0.6–0.8 mm in diam., longitudinally ribbed. Flowers (0.9)1–1.2(1.3) mm across, white to slightly yellowish.

Sepals broadly ovate, 0.6–0.7 mm long, 0.4–0.5 mm wide, concave, obtuse, slightly cucullate, with entire, often revolute margin. Petals narrowly lanceolate to almost linear, acute, straight and entire along the margin. Lip rather fleshy, simple, unlobed, oblong rectangular, slightly broadening to the base, truncate at apex, 0.6–0.7 mm long, 0.2–0.3 mm wide, straight along margin, at the base with shallow hemi orbicular fovea.

Miniature canopy and branch epiphyte. Submontane broad-leaved primary and old secondary humid cloud forest on granite, usually along small streams, 1000 m. Fl. February – December. Very rare.

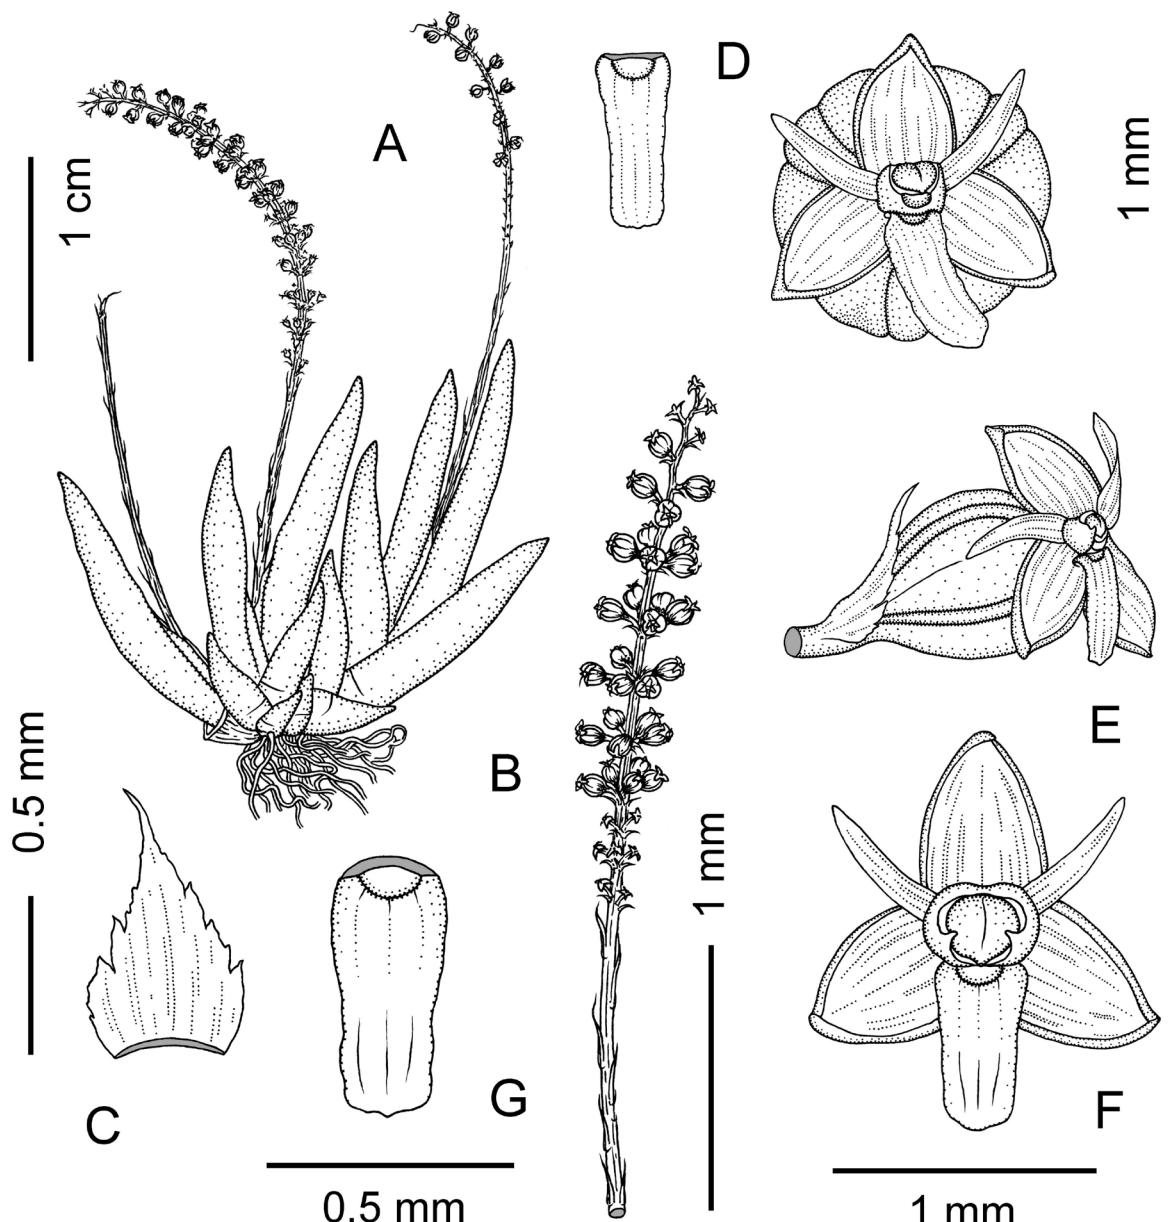

Fig. 9. New and rare orchids in the flora of Cambodia and Laos. *Oberonia simplex* Aver. A – flowering and fruiting plant; B – inflorescence; C – floral bract; D – flower and lip at fruiting stage, half side and frontal view; E – flower at fruiting stage, side view; F – flower, frontal view; G – lip, frontal view. All drawn from the type specimen (E. Konstantinov K-369) by L. Averyanov and T. Maisak.

Cambodia: Kampot. Endemic.

Species differs from all its known congeners by ligulate unlobed lip, which represents unique character in the genus.

Porpax Lindl.

P. capuccinorum Aver., sp. nov.

Described from southwestern Laos ("Khammouan prov., Thakhek district, Thakhek town area, near Pha Cave, branch epiphyte in canopy of lone tree 8–10 m tall, remnants of lowland broad-leaved woodlands at elev. about 156 m a.s.l. around point 17°29.540N, 105°09.917E"). **Type** ("3 November 2013, E. Konstantinov K-239.") – LE (holotype). **Epi-type** – d-EXSICCATES OF VIETNAMESE FLORA 0248/K 239.

Fig. 11; 12 (d-EXSICCATES OF VIETNAMESE FLORA 0248/K 239).

Species epithet refers resemblance of the flowers with traditional capuchin monk wear.

Perennial short creping or clustering sympodial miniature epiphytic herb. Rhizome short, tiny, negligible. Stems pseudobulbous, densely touching each other, 2-leaved; young stems, grassy-green, enveloped by whitish or greenish, scarious, hyaline leaf sheaths; mature pseudobulbs fleshy, dull olive-green, flattened, oblate to discoid-lenticular, (5)7–1(1.2) cm across, (2)2.5–3(3.5) mm tall, early deciduous, covered by light brownish scarious sheath in form of membrane with prominent nerves disintegrating later into persistent fibrous remnants. Leaves 2, appearing in individual stem before flowering, subsessile, sheathed; sheath tubular, later much broadening, enveloping pseudobulb; leaf blade conduplicate, with distinct median vein, horizontally recurved, bright green, rather thin, herbaceous, narrowly obovate, (1)1.5–2(2.2) cm long, (4.5)5–7(7.5) mm wide, obtuse, narrowing into short petiole-like base 1.5–2 mm long. Inflorescence one per stem, hysteranthous, arising from the apex of mature leafless pseudobulb, 1-flowered; scape, pedicel and ovary, light dull green, (3.5)4–5(5.5) mm long, 0.8–1(1.2) mm in diam., bent at apex; peduncle with 3–4 sterile and 1 floral bracts. Scape and floral bracts, large, scarious, hyaline, light brownish or yellowish, broadly triangular, tubular at the base, shortly acuminate at apex, (2)3–5(5.5) mm long, being flattened (2)2.5–6(6.5) mm wide. Pedicel and ovary shortly cylindrical, (0.8)1–1.2(1.4) mm long. Flowers horizontally spreading, not widely opening, entirely bright red to red-brown, glabrous, (4)5–7(8) mm across. Sepals forward directed; median sepal narrowly ovate to ovate, (5)5.5–6(6.5) mm long, (2.8)3–3.2(3.5) mm wide, apically recurved, shortly attenuate, joined in lower half with lateral sepals; lateral sepals oblique falcate, strongly bent down, concave, (7)7.5–8(8.5) mm long, (2.4)2.6–2.8(3) mm wide, round and apiculate at apex, joined each

other almost along all their length, forming at the base short, broad mentum (1.8)2–2.2(2.4) mm long and broad. Petals free, broadly obovate to almost round, finely irregularly crenulate along the margin, (3.8)4–4.2(4.4) mm across, somewhat incurved closing entrance to the flower. Lip simple, somewhat movable, entire, narrowly ovate, (2.8)3–3.2(3.4) mm long, (1.3)1.5–1.6(1.7) mm wide, glabrous, slightly recurved, narrowing to blunt apex, with no ornamentation, straight or slightly undulate along the margin, at the base with flat fleshy callus notched adaxially. Column red to orange-red, broad, erect, stout, shortly cylindric, (2.6)2.8–3(3.2) mm tall, (1.4)1.6–1.8(2) mm wide, on sides with small, insignificant, erect, acute stelidia; stigma concave; rostellum in form of small, thin, truncate plate; column foot short, thick, concave, 1 mm long, as wide as column base, slightly forward curved forming at apex short narrow stalk joined with lip base. Anther cap bright red, hemispheric, smooth, 0.8–1 mm tall and wide, truncate at front. Pollinia 8, yellow, in two groups, clavate, 0.2–0.3 mm long.

Miniature branch and trunk epiphyte. Primary and secondary dry semideciduous broad-leaved lowland forests on alluvial soils derived from limestone, 150–200 m. Fl. August – September. Rare.

Laos: Khammouan. Endemic.

Newly discovered plant belongs to group of species with hysteranthous inflorescence appearing from the apex of mature pseudobulb. From all representatives of this group new species strikingly differs in disproportionately long and broad lateral sepals (twice longer than median sepal) strongly bent down, almost round petals connivent with their apices at front of column and simple lip slightly undulate along the margin and notched at the base. Small population of this curious plant was found in canopy of lone remnant expiring tree remaining in almost completely deforested area, hence species should be regarded as critically endangered.

P. laosensis Aver., sp. nov.

Described from central Laos ("Vientiane province, Phou Khao Khouay National Protected Area to about 40 km NE of Vientiane, dry evergreen primary and secondary forest along rocky stream on sandstone at elevation about 350 m a.s.l. ..."). **Type** ("9 December 2015, L. Averyanov, T. Maisak, AL 159") – LE (holotype). **Epitype** – d-EXSICCATES OF VIETNAMESE FLORA 0247/AL 159.

Fig. 13, 14 (d-EXSICCATES OF VIETNAMESE FLORA 0247/AL 159).

Species epithet refers country of its origin.

Perennial short creping or clustering sympodial miniature epiphytic or lithophytic herb. Rhizome short, tiny, negligible. Stems pseudobulbous, densely touching each other, 2-leaved; young shoot, arising from the base of mature pseudobulb, during anthesis grassy-green, (2)2.5–3(3.5) mm long, 1.5–2 mm in diam., enveloped by 3–4 white, scarious, hyaline, triangular-tubular bracts (3)3.5–5(5.5) mm long and wide (being flattened), bearing 2 juvenile sessile, cordate leaves (1.5)1.8–2.2(2.4) mm long and wide, and apical inflorescence; mature pseudobulbs fleshy, dull green, flattened, oblate to discoid-lenticular, broadly obovate of flabelliform in outline, (0.7)9–1.4(1.6) cm across, (2.2)2.5–3.5(4) mm thick, early deciduous, covered by brownish scarious sheath in form of reticulate, cage-like membrane with prominent nerves disintegrating later into reticular fibrous remnants, oldest pseudobulbs almost naked. Leaves 2, sessile, developing in individual shoot after flowering, caducous to the end of pseudobulb formation. Inflorescence proteranthous, one per stem, arising from the apex of young shoot, 1-flowered; scape, pedicel and ovary, white to greenish, (2)2.5–3(3.5) mm long, 0.8–1 mm in diam., straight or slightly ascending. Floral bract, large, scarious, hyaline, white, broadly obovate to almost subquadrate, (3.6)3.8–4.2(4.4) mm long, (4)4.2–4.5(4.7) mm wide, tubular, finely incise or denticulate along truncated apex, with more or less prominent central acute dent. Pedicel and ovary shortly cylindrical, (1.4)1.6–1.8(2) mm long, 1.2–1.5 mm in diam., glabrous or with few scarce scurfy hairs. Flowers horizontally spreading, entirely red-brown, glabrous, not widely opening, tubular, (1.8)2–2.2(2.4) mm across, (5)5.5–7(7.5) mm long. Sepals (5)5.5–6(6.5) long, forward directed,

concave, united, forming tube; median sepal joined with lateral sepals on 2/3 from the base, free part broadening, broadly ovate, (2)2.2–2.8(3) mm long and wide, obtuse, straight or finely undulate along the margin; lateral sepals cymbiform, straight, joined each other almost along all their length, with free lobes (0.8)1–1.5(1.6) mm long, (1.4)1.6–1.8(2) mm wide, finely undulate and cucullate at apex. Petals free, broadly lanceolate, oblique falcate, as long as sepals or little longer, 0.8–1.2 mm wide, acute, in apical half finely papillose and involute along the margin. Lip simple, somewhat movable, entire, rectangular with fleshy triangular apex, (3.2)2.5–3(3.2) mm long, (1.3)1.4–1.5(1.6) mm wide, glabrous, slightly recurved, at the base with flat insufficient callus obscurely notched adaxially, entire or finely crenulate along the margin, placed on short, narrow claw 0.5–0.6 mm long. Column red-brown, broad, erect, stout, shortly cylindric, (1.4)1.6–1.8(2) mm tall, (0.7)0.8–1(1.2) mm wide; at the apex from both sides with small triangular stelidia; stigma concave; rostellum in form of small, thin, truncate plate; column foot insufficient, in form of forward curved stalk joined to the lip base. Anther cap red-brown, broadly conoid, globular at the apex, smooth, 0.5–0.6 mm tall and wide, at front broadly truncate. Pollinia 8, yellowish, in two groups, oblate, about 0.25 mm across. Fruit dark dirty brown to almost black, oblique, half-globular capsule (4.5)5–5.5(6) mm long and wide, ribbed on sides, opening by two splits on ventral flattened surface, placed on bent pedicel 1.5–2.5 mm long enveloped by scarious remnant of floral bract.

Miniature trunk epiphyte and lithophyte. Primary and secondary dry evergreen broad-leaved lowland forests on sandstone, commonly along streams and small rivers, 350–400 m. Fl. March–April. Locally common.

Laos: Vientiane. Endemic.

New plant belongs to group of species with proteranthous inflorescence appearing from the base of mature pseudobulb. From all species of this group new plant well differs in glabrous narrow flowers, free narrowly lanceolate finely papillulate petals involute along the margin and in short simple rectangular lip with acute-triangular apex. New species in its *locus classicus* was observed as common plant with large visually stable population.

1858, Journ. Proc. Linn. Soc., Bot. 3: 63; Schuit. et al., 2008, Nord. Journ. Bot. 26: 311; Aver., 2013, Turczaninowia 16, 4: 43.

Southern Cambodia, to the N of Sihanoukville town, Kaoh Rong Island in Siam Gulf, 19 November 2011, T. Maisak, M. Telepova, L. Osinovetz, 912 (LE). Northeastern Laos, Houaphan province, Hem district, Nacoc village, 12 April 2015, N. T. Hiep, L. Averyanov, N. S. Khang et al., LA-VN 1444 (HNL, FOF, LE).

Miniature epiphyte and occasionally lithophyte. Primary and secondary broad-leaved evergreen forests on any kind of soil, often on rocky limestone

near mountain tops, 50–1200 m. Fl. April – August.
Not rare.

India, Nepal, Myanmar, S. China, Thailand, Vietnam, Malacca Peninsula, Sumatra, Java, Kalimantan, Sulawesi, Lesser Sunda Islands, Philippines, New Guinea, tropical Pacific islands. Laos: Bolikhambai, Houaphan, Khammouan, Vientiane. Cambodia: Sihanoukville.

***Thrixspermum* Lour.**

^L ***T. calceolum*** (Lindl.) Rchb. f.,

1868, *Xenia Orchid.* 2: 122.

Northeastern Laos, Houaphan province, Viengxay district, Vieng Xai village, 7 April 2015, N. T. Hiep, L. Averyanov, N. S. Khang et al., LA-VN 1148a (HNL, FOF, LE).

Epiphyte and lithophyte. Primary and secondary broad-leaved evergreen open forests on rocky limestone, commonly on hill and mountain tops, 800–950 m. Fl. April – July. Rare.

Thailand, Vietnam, Malacca Peninsula, Sumatra, Borneo. Laos: Houaphan.

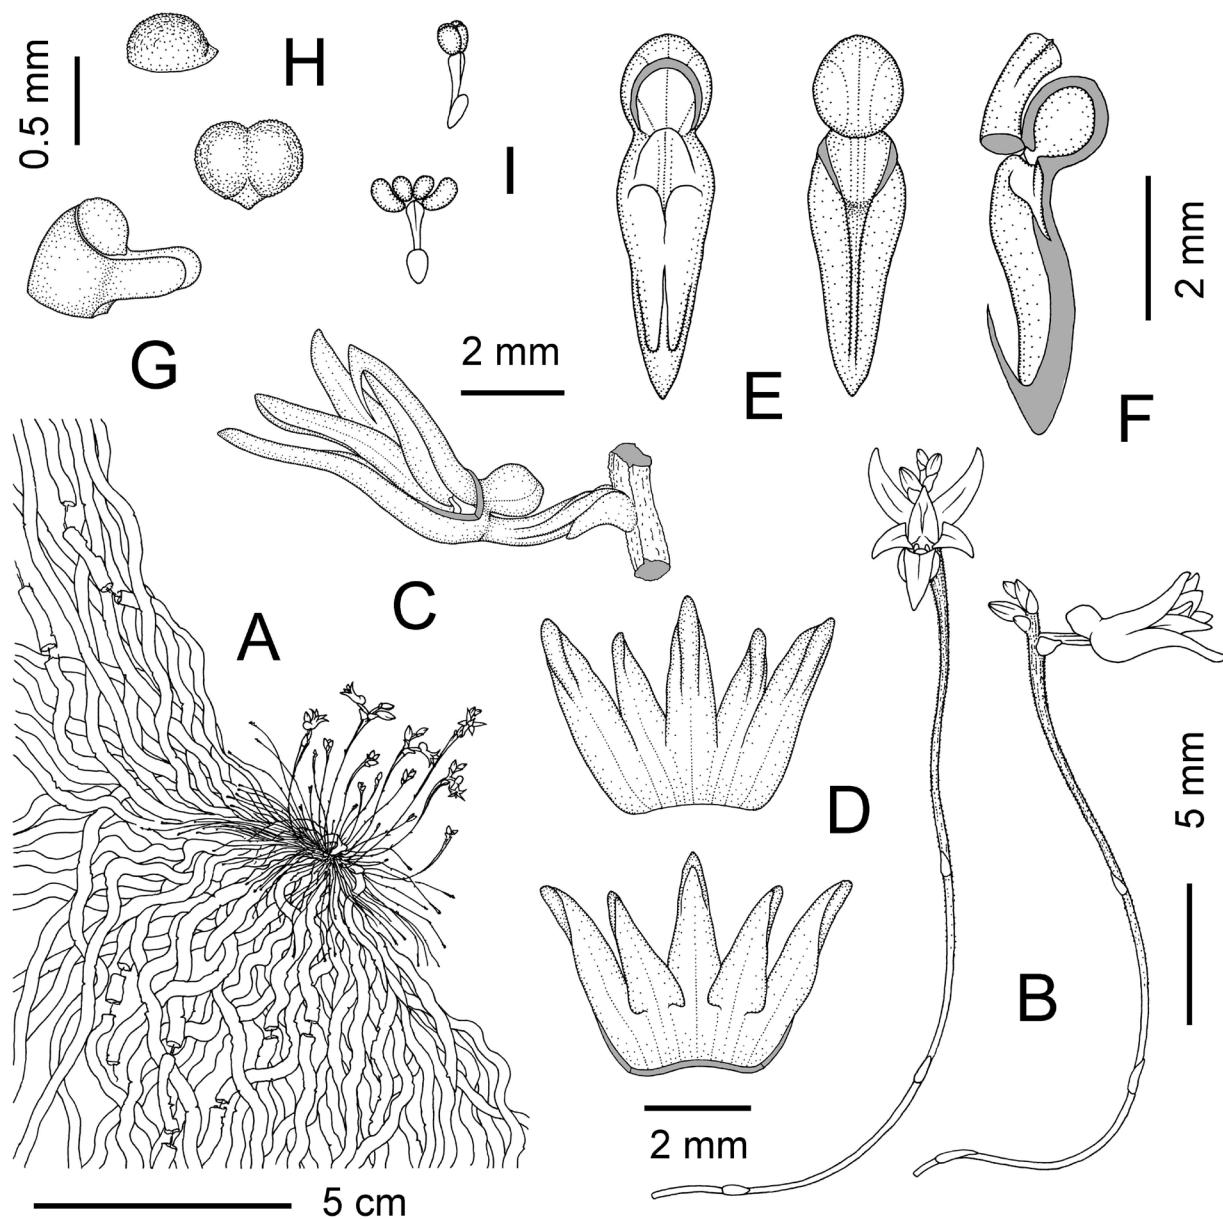

Fig. 15. New and rare orchids in the flora of Cambodia and Laos. *Taeniophyllum filiferum* Aver. A – Flowering plant. B – Inflorescences; C – Flower with lateral sepal and petal removed, side view. D – Flattened sepals and petals, abaxial and adaxial surface. E – lip, view from above and from below. F – Lip, sagittal section. G – Column, side view. H – Operculum. I – Pollinarium, frontal and side views. All drawn from the type specimen – LA-VN 1174b / TM 1273 by L. Averyanov.
