Updated checklist of the Umbelliferae of Middle Asia and Kazakhstan: nomenclature, synonymy, typification, distribution

M. G. Pimenov

Botanical Garden, Lomonosov Moscow State university, Vorobjevy Gory, Moscow, 117234, Russian Federation.

E-mails: mgpimenov@mail.ru, mgpimenov@gmail.com

Keywords: Apiaceae, carrot family, endemic species, Kazakhstan, lectotypification, Middle Asia, phytogeography, synonyms, systematics, taxonomy.

Summary. The region of Middle Asia and Kazakhstan with 107 genera, 459 species and 204 endemic species is one of essential Umbelliferae diversity centers not only in Asia, but also in the world. The biggest Umbelliferae genera in the region are *Ferula* (100 species), *Seseli* (49), *Elwendia* (19), *Bupleurum* (18), *Elaeosticta* (18), *Prangos* (16), *Semenovia* (16). The diversity of the family by country is as follows: Kazakhstan (82 genera – 211 species – 28 endemic species), Uzbekistan (68 – 200 – 18, respectively), Kyrgyzstan (65 – 192 – 29), Tajikistan (65 – 176 – 20), and Turkmenistan (51 – 122 – 9). The latter differs considerably from other countries of the region not only in lesser diversity, but also in generic and specific sets, approaching the features of Iranian Umbelliferae. The distribution of species was described with regard to provinces of all five countries. The list of endemic species for each country was compiled on the basis of field, herbarium and published data. There are 16 endemic genera in Middle Asia and Kazakhstan, including *Astomatopsis*, *Autumnalia*, *Fergania*, *Kafirnigania*, *Karatavia*, *Komarovia*, *Kuramosciadium*, *Lipskya*, *Mogolotvia*, *Paulita*, *Pilopleura*, *Schtschurovskia*, *Sclerotiaria*, *Sphaenolobium*, *Sphaerosciadium*, and *Tschulaktavia*, 6 other genera being subendemics. Across the region the important border between Middle Asian (eastern part of SW Asian floristic province of the Mediterranean type) and Central Asian phytochoria passes; the former being considerably richer in the Umbelliferae than the latter.

Обновленный конспект зонтичных (Umbelliferae) Средней Азии и Казахстана: номенклатура, синонимия, типификация, распространение

М. Г. Пименов

*Ботанический сад Московского государственного университета им. М. В. Ломоносова,
Воробьевы Горы, г. Москва, 117234, Россия*

Ключевые слова: зонтичные, Казахстан, лектотипификация., синонимы, систематика, Средняя Азия, таксономия, фитогеография, эндемичные виды, Apiaceae.

Аннотация. Регион Средней Азии и Казахстана со 107 родами, 459 видами и 204 эндемичными видами представляет собой один из важнейших центров разнообразия Umbelliferae не только в Азии, но и в мировом масштабе. Крупнейшими родами зонтичных в регионе являются *Ferula* (100 видов), *Seseli* (49), *Elwendia* (19), *Bupleurum* (18), *Elaeosticta* (18), *Prangos* (16), *Semenovia* (16). В зависимости от страны, разнообразие семейства распределяется следующим образом: Казахстан (82 рода – 211 видов – 28 эндемичных видов), Узбекистан (68 – 200 – 18 соответственно), Кыргызстан (65 – 192 – 29), Таджикистан (65 – 176 – 20) и Туркменистан (51 – 122 – 9). Последняя отличается от других стран региона не только меньшим разнообразием, но и существенно другим родовым и видовым набором, приближающимся к особенностям Umbelliferae иранской флоры. Детали в распределении видов рассматривались по провинциям всех пяти стран. Список эндемичных видов для

каждой страны был составлен на основе полевых и опубликованных данных. В Средней Азии и Казахстане насчитывается 16 эндемичных родов – *Astomatopsis*, *Autumnalia*, *Fergania*, *Kafirnigania*, *Karatavia*, *Komarovia*, *Kuramosciadium*, *Lipskya*, *Mogoltavia*, *Paulita*, *Pilopleura*, *Schtschurowska*, *Sclerotiaria*, *Sphaenolobium*, *Sphaerosciadium* и *Tschulaktavia*. Через регион проходит важная флористическая граница между собственно ботанической Средней Азией (восточная часть ЮЗ Азиатской флористической провинции средиземноморского типа) и центральноазиатской фитохорией; первая значительно богаче зонтичными, чем вторая.

Introduction

Like the publication of the previous synopsis on nomenclature, synonymy, typification, and distribution of some Asian Umbelliferae (“Updated checklist of Chinese Umbelliferae”, Pimenov, 2017, 2018), this new review has been compiled from materials stored in the GNOM and ASIUM databases (Pimenov, Leonov, 1993, 2002, 2004) at the Botanical Garden of Lomonosov Moscow State University (original software by M. W. Leonov). This review is dedicated to another important World center in of the diversity of the family taxa in Asia, namely Middle Asia and Kazakhstan. The taxonomic basis of the present publication has been updated with regard to the latest monograph of the family (Plunkett et al., 2019).

The boundaries and terminology related to the phytocchorion of Middle Asia and Kazakhstan will provide some clarification, due to different interpretations in general and botanical-geographical literature. Apparently, the term “Middle Asia” appeared in Russian literature in the works of the outstanding historian S. M. Solovyev (first volume was published ad 1851), who explains this term as the area southward of the Russian Plain and eastward of the Caspian Sea. The pioneer in the use of the term in botanical literature was probably V. I. Lipsky (1900, 1904, 1910); in his “Materials ...” it is explained that Middle Asia is Russian Turkestan plus the Bukhara and Khiva khanates. After local national states became independent, the phrase “Central Asia” was often used instead of “Middle Asia”. Being acceptable in a political context, these terms, however, create confusion in plant geography, since the botanical “Middle Asia” and “Central Asia” denote two considerably different contrast phytocchoria (Grubov, 1959; Kamelin, 1973, 1990; Takhtajan, 1978).

In the botanico-geographical part of this publication, the most important task was to adequately and sufficiently detailed characterize the distribution of each species of the MA & K. Umbelliferae It is much easier to register actual plant distribution with regard to administrative-territorial division (states, provinces and districts) than constantly changing borders of phytocchoria in different author’s inter-

pretation. Therefore, species distribution is shown here by country (Kazakhstan, Tajikistan, Uzbekistan, and Turkmenistan) and its currently accepted provinces. The geographical names used are spelt as in the Times Atlas of the World: Comprehensive Edition (2011).

The characteristics by countries and provinces, compiled taking into account numerous literary, herbarium and field data, are the most accurate and pragmatic from the point of view of further use. But to this I tried to add a botanico-geographical characteristic (regardless of the administrative boundaries), but in the most general form, since there are numerous and difficult to eliminate contradictions between the data of different authors on the botanical regionalization of Asia. Here Asia is divided in total into phytocchories, and for each species one or several phytocchories are indicated (+ non-Asian continents, in case of wide distribution).

There is a series of prominent original books by R. V. Kamelin (1973, 1979, 1990, 1998) devoted to the florogenetic analysis of the natural flora of mountainous Middle Asia and adjacent territories (for example, the Altai mountainous country in a broad sense). In these works, materials on the flowering plants of wide taxonomic range are also a unique basis for clarifying particular issues of botanical geography, allow us to consider the Umbelliferae against the background of regional and often global problems of flora.

In recent posthumous publications by R. V. Kamelin (2017, 2018), the region of Mountainous Middle Asia is included in the SW Asian province (\approx “Переднеазиатская область”) of the Ancient Mediterranean subkingdom, while the territory of Kazakhstan covers parts of three floristic provinces – two Ancient Mediterranean (SW Asian and Sahara-Gobi provinces) and one of Boreal subkingdom (the Steppe province). This is a broader viewpoint on Asian biogeography, in particular on Mediterranean (Ancien Mediterranean) phytocchorion, the part of which is the greater Middle Asia. The same was the position of Meusel (1971), the Mediterranean of whom reaches foothills of the Himalaya. Apparently, the modern understanding of the specifics of this region goes back to the ideas of the eastern Ancient

Mediterranean and even to “flora orientalis” by P. E. Boissier.

In contrast to Chinese Umbelliferae, investigated by botanists from different countries, the Middle Asian representatives of the family were studied almost entirely within the framework of one botanical school, namely Russian or Soviet, and of its derivatives after the collapse of the Soviet Union, with little involvement of foreign scientists. Even if there were some botanists of different ethnic background, like A. Schrenk, A. Bunge, A. Lenmann etc., they lived and served in the Russian Empire, and therefore can hardly be considered foreigners.

Although 33 Umbelliferae species currently known from the territory of Middle Asia and Kazakhstan were described by Linnaeus (1753), the true regional diversity of the family began to show itself only in the first half of the 19th century, when the first original researchers with their herbaria came to the region. In particular, these were A. Lehmann, whose herbarium was treated by A. Bunge (1843, 1848, 1854), in mountainous Middle Asia, and G. S. Karelín & I. P. Kirilov (1841, 1842; see also Botschantzev, 1976; Gubanov et al., 1998) and independently A. Schrenk (1843); Fischer & Meyer (1841, 1842, 1845) in North and East Kazakhstan. For instance, A. Bunge described the new genera *Hyalolaena* Bunge and *Eremodaucus* Bunge on the basis of Lehmann's collection. The Schrenk's collection was studied not only by the botanist himself, but also by Fisher and C. A. Meyer, Regel and Schmalhausen, Trautvetter and other taxonomists.

As various parts of Middle Asia gradually joined or became associated with the Russian Empire, their botanical research intensified (Borszczov, 1860; Regel, Herder, 1866; Osten-Saken, Ruprecht, 1869; Kaufmann, 1870, 1871; Regel et Schmalhausen, 1878a-b, 1882; Franchet, 1883; Lipsky, 1896, 1900, 1904; Fedtschenko, 1899, 1902; Kosopoljansky, 1913a-б, 1914, 1915a-б, 1916a-б, 1921, 1922, 1925). At this time, the new genera *Albertia* Regel et Schmalh., *Angelocarpa* Rupr., *Euryangium* Kauffm., *Galagania* Lipsky, *Holopleura* Regel et Schmalh., *Korshinskia* Lipsky, *Kozlovia* Lipsky, *Ladyginia* Lipsky, *Renarda* Regel, *Schtschurowskia* Regel et Schmalh., and *Semenovia* Regel were described from the region. The results of botanical studies, carried out in this period were summed up by B. A. Fedtschenko (Fedtschenko O. A., Fedtschenko B. A., 1909; Fedtschenko, 1915), and B. M. Kosopoljansky (1920).

It should be noted that multiple taxonomic questions regarding local genera and species of the Um-

belliferae became clearer after the publication of Boissier's “Flora Orientalis” (Boissier, 1872, 1888), which included 25 species from Middle Asia and Kazakhstan, as well as 56 species of the family described from neighboring countries and later found in Middle Asia. Nomenclature of the Umbelliferae of Boissier's Oriental herbarium, kept now in the Conservatoire et Jardin Botaniques de la ville de Genève (G-BOIS), was critically studied by Pimenov & Jacquemoud (2020).

After the Revolution, regional research centers were set up in Middle Asia and Kazakhstan, such as universities, botanical gardens, and academic institutions with herbaria. Regional botanical schools appeared in Tashkent, Alma-Ata, Dushanbe, Ashgabat and some other cities, led by prominent scientists who came from the central USSR for a permanent job. The biggest school appeared in Tashkent with the core in the Middle Asian University. Tashkent became the regional center in Umbelliferae investigation too. Prominent botanist prof. E. P. Korovin, with broad interests in taxonomy, phylogeny, ecology, floristics, geobotany and plant morphology, since 1923 until his death in 1963 published the regional treatments of Umbelliferae from Turkmenistan (Korovin, 1950), Uzbekistan (Korovin, 1959), Kazakhstan (Korovin, 1963) and Tajikistan (Korovin et al., 1984), compiled an unique illustrated monograph of the genus *Ferula* (Korovin, 1947) and critically studied many other Umbelliferae genera. The treatment of Umbelliferae in “Flora of the USSR” (1950, 1951), in which the majority of the genera were processed by prof. B. K. Schischkin from the Komarov Botanical Institute of RAS, summed up the knowledge on the Umbelliferae from Middle Asia, including five new genera and 26 new species from the region.

Next new regional Umbelliferae treatment was published (Pimenov, 1983), which was a part of critical summary of the Middle Asian flora except that of the northern boreal part of Kazakhstan, without morphological descriptions and with determination keys, extensive synonymy of species, and distribution of species in the mountainous part of the territory, based on ridges rather than administrative subdivisions. The multivolume publication was conceived by Tashkent botanists under the leadership of A. I. Vvedensky, to include 15 new Umbelliferae species. Subsequent seven years were very difficult for the whole Soviet science, in particular due to severe financial limitations, especially in the national republics of Middle Asia and in Kazakhstan. Nevertheless, some scientific projects in taxonomic and

floristic botany continued. A regional summary of Umbelliferae for Tajikistan (Korovin et al., 1984) was published, and that for Kyrgyzstan was started, to be come out later (Pimenov, Kljuykov, 2002).

The last period (2016–2020) saw the continuation of the description of new taxa from Middle Asia and Kazakhstan, against the background of profound political changes in the region, including the formation of five independent states from the former Soviet Republics, followed by dramatic events in some of them, especially in Tajikistan and Turkmenistan, which hampered or even destroyed local science. The old scientific schools largely ceased to exist. In fact, botanical activity persisted only in Tashkent, where a new floristic project, “Flora of Uzbekistan”, began. Only three volumes have so far been published (2016–2019), containing the treatment of Amaryllidaceae (Khassanov, 2016), and some other families (Flora of Uzbekistan, Sennikov (ed.), 2016, 2017, 2019); treatments of some other families, including Umbelliferae (Apiaceae), are still being prepared. In the botanical garden of Moscow State University, an extensive effort in critical studies of Asian Umbelliferae based on integrative taxonomy is under way. In contrast to earlier research, these investigations, including field studies and the checking of local herbaria, involve such neighboring Asian countries, as China, Turkey, Iran, India, Nepal, and even Afghanistan, which enables one to treat Middle Asian taxa in a broader context. Herbarium collections, including type ones, kept in World herbaria, as K, P, BM, E, G, B, S, L, M, JE, etc., became available. Treatments or up-to-date listings of the Umbelliferae from neighboring countries were published, including Russia (Pimenov, Ostroumova, 2012), China (She Menglan et al., 2005; Pimenov, 20176, 2018), Kyrgyzstan (Pimenov, Kljuykov, 2002), Afghanistan (Brehle et al., 2013), Iran (Mozaffarian, 2007), Turkey (Güner et al., 2012) and others, as well as numerous articles, partly concerning the Middle Asian region. It would be impossible to enumerate all these publications here, however some of them can be found in the reference list or nomenclatural citations for a particular species.

Specially, for this publication and a separate review of the type materials, kept in TASH, the barcoding of Umbelliferae types of TASH have been carried out using HerbScan TM224 and Epson Exptression 100000XL with resolution 360dpi and 600 dpi, respecuvely under the guidance of Prof. Komiljon Tojibaev, the Director of the Institute of Botany of the Academy of Sciences of Republic of

Uzbekistan. New collections, made by botanists of this institute, for instance the interesting gatherings by Orzimat Turginov with colleagues in the mountains, arrounding Fergana, were also included. The newly accepted barcodes for broader type collection of the Umbelliferae of Middle Asia were made in St. Petersburg (LE). They are used in the present publication.

The structure of this publication is similar to that of Chinese Umbelliferae Conspectus, and provides for each taxon (species or sometimes infraspecific taxon) the accepted name, the data of the protologue, the basionym, if different from the accepted name, the type materials, synonyms (with the same data as for accepted names), and distribution by country and province, and outside the considered region by countries, as well as inclusion in large phytocoria (SW Asia, Central Asia, and so on). Barcodes of type material would be of use, however there are few of them for specific taxa of this region thus far. As of today, all herbarium materials at Moscow University (MW) and a small part of huge type collections at the Komarov Botanical Institute (LE), including Umbelliferae types of Middle Asia, have been digitized. In connection with this publication, the barcodes were recently generated (under the guidance of K. Sh. Tojibaev, the Director of the Institute of Botany of Academy of Sciences of Republic of Uzbekistan) for type material, kept in TASH, the most essential and rich herbarium collection located in the Middle Asian region.

Conspectus of the Umbelliferae of Middle Asia and Kazakhstan (MA & K)

Aegopodium alpestre Ledeb., 1829, Fl. Altaic. (Ledebour) 1: 354.

≡ *Carum alpestre* (Ledeb.) Koso-Pol., 1916, Bull. Soc. Imp. Naturalistes Moscou, n. s. 29: 199.

Type: RUSSIA. [Altai] “Tscharysch, Meyer [Ledebour] 414 (268/742/918)” (lectotype LE!, designated by V. M. Vinogradova (2005: 958); isolectotypes C! [C10005768]; Circa fontes fl. Belaja Uba et Tscharysch, VII 1826, Meyer [Ledebour] (syntypes LE!, P! [P02518728, P02518744]); KAZAKHSTAN. In subumbrosis alpestribus v. gr. in latere boreali montis crucis prope Ridder sk. Meyer [Ledebour] (syntype LE?).

Distribution in MA & K: Kazakhstan (NE: E Kazakhstan prov.).

Distribution in other Asian countries: Russia, China, Japan, Korea, Mongolia.

Distribution area: Northern and Eastern Asia.

Aegopodium kashmiricum (R. R. Stewart ex Dunn) Pimenov, 1992, Byull. Moskovsk. Obshch. Isp. Prir. Otd. Biol. 97(4): 114.

≡ *Pimpinella kashmirica* R. R. Stewart ex Dunn, 1924, Bull. Misc. Inform. Kew: 384.

Type: INDIA. “NW India, Sonamarg, at 3–4000 m, VII 1921, *Stewart 6267*” (lectotype K! [K000685615], designated by Pimenov, 2018, in *Turczaninowia* 21, 1: 117).

— *Aegopodium alpestre* auct. non Ledeb.: O. et B. Fedtsch., 1911, Beih. Bot. Centralbl. 28(2): 30, p. p.

— *Aegopodium tadshikorum* auct. non Schischk.: V. M. Vinogr. 1988, Novit. Syst. Pl. Vasc. 25: 121, p. p.

Distribution in MA & K: Kazakhstan (SE: Almaty prov.), Kyrgyzstan (Batken prov., Jalal-Abad prov., Ysyk-köl prov., Osh prov., Naryn prov., Talas prov., Chüh prov.), Uzbekistan (Toshkent prov.).

Distribution in other Asian countries: China, India, Pakistan.

Distribution area: Central, South-Western and Eastern Asia.

Aegopodium podagraria L., 1753, Sp. Pl.: 265.

Type: EUROPE. “In Europa ad sepes inque pomariis, 107, *Aegopodium I*” (lectotype BM-Cliff.! [BM000558400], designated by Reduron & Jarvis, 1993: 15; see also Reduron, 2007).

Distribution in MA & K: Kazakhstan (N: Akmola prov.; NE: E Kazakhstan prov.).

Distribution in other Asian countries: Russia, Georgia, Turkey.

Distribution area: Asia (Northern), Europa, N. America, Australia & Oceania.

Aegopodium tadshikorum Schischk., 1950, in Schischkin (ed.), Fl. URSS 16: 600, 456.

Type: TAJIKISTAN. “Asia Media, Baldzhuan, in faucibus fl. Jach-su, 04 VII 1897, Lipsky” (holotype LE! [LE01065718]).

— *Aegopodium podagraria* auct. non L.: O. et B. Fedtsch., 1909, Conspl. Fl. Turkest. 3: 81.

Distribution in MA & K: Kazakhstan (NE: E Kazakhstan prov.; S: S Kazakhstan prov., Zhambyl prov.; SE: Almaty prov.), Kyrgyzstan (Batken prov., Jalal-Abad prov., Ysyk-köl prov., Osh prov., Talas prov., Chüh prov.), Tajikistan (Kühistoni Badakhshan, Sughd prov., Khatlon prov., Dushanbe prov.), Uzbekistan (Samarqand prov., Qashqadarya prov., Toshkent prov.).

Distribution in other Asian countries: China.

Distribution area: Central and South-Western Asia.

Anethum involucratum Korovin, 1947, Not. Syst. Herb. Inst. Bot. & Zool. Acad. Sci. Uzbekistan 8: 11.

Type: UZBEKISTAN. “Pamir-Alaj, vallis fluv. Kaschka-Darja, in regione urbis Karschi, 1928, *Linchezvski* 273” (holotype TASH – not found).

Note: Very critical or even enigmatic species. Korovin's description does not correspond to the characteristics of the genus *Anethum* (Schischkin, 1951: 17), distributed in the Middle Asia only in culture, but rather to the characters of the genus *Galagania*. The final decision can be obtained by examining a type specimen. Schischkin (l.c.) believed that the type of this name is in Tashkent. Unfortunately, it was not found in Tashkent herbaria. The question remains open. Nevertheless, Kljuykov (2020), who does not have a type or other reliable material according to *Anethum involucratum*, considered it possible to transfer the species to the genus *Galagania* with a new nomenclature combination and put the newly described species in the synonymy of it. Until the type of *Anethum involucratum* has been found, all this is not very good. In the Karshi region, from where *A. involucratum* was described as a weed in the field *Anethum tenuiseptum* is a fairly common species.

Angelica brevicaulis (Rupr.) B. Fedtsch., 1909, Conspl. Fl. Turkest. (O. A. Fedtschenko et B. A. Fedtschenko) 3: 99; ejusd. 1911, Beih. Bot. Centralbl. 28(2): 44.

— *Bunium cylindricum* auct. non Drude: Korovin, 1950, in Schischkin (ed.), Fl. URSS 16: 411, p. p.

Distribution in MA & K: Kyrgyzstan (Batken prov.), Tajikistan (Sughd prov.), Uzbekistan (Dzhizak prov., Navoi prov., Samarcand prov., Qashqadarya prov., Sirdarya prov.). Endemic.

Distribution area: South-Western Asia.

Note: The description of this species, as well as of other species in Korovin (1924a) does not contain material for species typification. This is right also for Korovin's publications of 1923 and some subsequent years.

Elwendia sary-cheleki (Lazkov et Kljuykov) Pimenov et Kljuykov, 2013, Pl. Syst. Evol. 299 (5): 1004.

≡ *Bunium sary-cheleki* Lazkov et Kljuykov, 2011, Bot. Zhurn. (St. Petersburg) 96(7): 967.

Type: KYRGYZSTAN. “Jugum Chatkalicum, ripa sinistra fluvii Chodscha-Ata, in viciniis pagi Arkit, in saxosis, 1250 m s. m. 41°47'02.4" lat. bor., 71°57' long. or. 04 VI 2010. *Lazkov*” (holotype LE! [LE00051623]; isotypes FRU, LE! [LE00051625], MW! [MW0593826]).

Distribution in MA & K: Kyrgyzstan (Jalal-Abad prov.). Endemic.

Distribution area: South-Western Asia.

Elwendia seravschanica (Korovin) Pimenov et Kljuykov, 2013, Pl. Syst. Evol. 299 (5): 1004.

≡ *Bunium seravschanicum* Korovin, 1927, Byull. Sredne-Asiatsk. Gosud. Univ. 15: 125.

Type: TAJIKISTAN. “Asia Media, Prov. Samarkand, Semurutsch inter Kschut et lacum Kul-i Kalon, 8–9000'. 21 VI–03 VII 1882. *A. Regel*” (lectotype LE!; designated by Kljuykov et al., 2018: 218).

Note: Lectotype, previously selected by Vinogradova, 1997a: 97 (“Buchara, prov. Rochan supra cast. Kala-i-Vamir in ascensu, faucium Odidi in lapidosis, 8700–9000', 10 VIII 1901, *Alexeenko*” (lectotype TASH!, designated by Korovin 1950b: 405; isolectotype LE!)), did not origin from Zeravshan basin as Rochan is a locality from Badakhshan. Kljuykov et al. (2018) stated morphological difference between Rochan plants and those from Seravshan basin as the former have subglobose fruits, shorter stylods and weekly refracted leaf blades. They believed that lectotype, previously selected by V. M. Vinogradova (1997a: 97), which differs from Zeravshan plants, could be attributed to another species. In Tashkent herbarium (TASH) no duplicates of Alexeenko's gatherings from Rochan were found.

Distribution in MA & K: Tajikistan (Sughd prov.), Uzbekistan (Dzhizak prov., Qashqadarya prov., Samarcand prov.). Endemic.

Distribution area: South-Western Asia.

Distribution area: South-Western Asia

Note: – It is very difficult to determine whether the numerous herbarium sheets of the species in type collection TASH (usually part of stem and leaf or part of stem and umbel) are parts of a single plant or several plants of the same population (most likely). If collectors used several plants, some sheets should be considered as isolectotypes, but which one is a big problem. See also *F. tuberifera*, *Dorema sabulosum* and some big Umbellifers.

Type: KYRGYZSTAN. "Kyrgyzstan australis, jugum Czatkalense, in valle fluvii Kassansai, inter Kysyl-Tokoi et Terek-sai, montes gypsacei et rubroarenosi, 14 VI 1971, *Pimenov, Baranova & Kluykov*" (holotype MW! [MW0594005]; isotypes LE!, MW [MW0594004]).

— *Ferula foetidissima* auct. non Regel et Schmalh.: Golovkova, 1959, in Fl. Kirgh. SSR 8: 86, p. p.

Distribution in MA & K: Kyrgyzstan (Jalal-Abad prov.). Endemic.

Distribution area: South-Western Asia.

Ferula juniperina Korovin, 1959, Bot. Mater. Gerb. Bot. Inst. Komarova Akad. Nauk SSSR 19: 338. **Type:** UZBEKISTAN. "Montes Thian-Schan occidentalis, pars superior fluv. Angren, in valle Urges-say, inter silvas juniperinas, 21 VI 1953, *E. P. Korovin & S. E. Korovin* 450–453" (holotype TASH! [TASH002424–TASH002427]).

= *Ferula kirialovii* Pimenov, 1979, Byull. Moskovsk. Obshch. Isp. Prir. Otd. Biol. 84(5): 110.

Type: UZBEKISTAN. "Tian-Schan occidentalis, Tschimgan, 16 VII 1897, *O. A. Fedtschenko*" (holotype LE! [LE00051814, LE00051815, LE00051816]).

— *Peucedanum pseudoreoselinum* auct. non Regel et Schmalh.: O. et B. Fedtsch., 1909, Conspl. fl. Turkest. (O. A. Fedtschenko et B. A. Fedtschenko) 3: 110, p. p.

— *Ferula pseudoreoselinum* auct. non Koso-Pol.: Korovin, 1947, Ill. Monogr. Ferula: 64, tab. 15, fig. 2.

Distribution in MA et K: Kazakhstan (S: S Kazakhstan prov. Dzambyl prov.), Kyrgyzstan (Jalal-Abad prov.), Tajikistan (Sughd prov.), Uzbekistan (Toshkent prov.). Endemic.

Distribution area: South-Western Asia.

Note: The name of priority (*F. juniperina*) for the species was clarified after the publication of a critical

revision (Pimenov, 1979) of sect. *Euryangium* of the genus *Ferula*, to which the species belongs. This was possible during a checking of the type collection in TASH. Type material of *F. juniperina* from basin of riv. Angren is not in good condition; so its identification required some additional efforts.

Ferula karakalensis Korovin, 1947, Ill. Monogr. Ferula: 29, tab. 5, fig. 2.

Type: TURKMENISTAN. "Regio Transcaspica, distr. Karakala, ad st. Dshalil. 13 V 1916. *Czerniakowska* 1024" (holotype LE! [LE00050264, LE00050265]).

= *Ferula tersakensis* Korovin, 1947, Ill. Monogr. Ferula: 26, tab. 4, fig. 2.

Type: TURKMENISTAN. "Tersakan, Radde" (holotype LE [LE00051918]).

Distribution in MA & K: Turkmenistan (Balkan prov.).

Distribution in other Asian countries: Iran.

Distribution area: South-Western Asia.

Distribution in MA & K: Uzbekistan (Toshkent prov.). Endemic.

Distribution area: South-Western Asia.

Note: The issue of *Kamelinia*’s generic independence remains to be debatable, is *Kamelinia* independent genus or a part of *Korshinskia*. There are arguments *pro et contra*, and, in our opinion, there are more of the latters. The essential difference between *Kamelinia* s. str. (*K. tianschanica*, but not *K. kopetdagensis*) and *Korshinskia* is only the structure of the underground part of plants, while the independence of *Kamelinia* is not confirmed by molecular (G.V. Degtjareva, unpublished) and partly by carpological data. At the same time, not only the independence of the species *K. tianschanica*, but also its more or less isolated position among the species of *Korshinskia* is obvious. Most likely, this species should be distinguished as a monotypic subgenus within *Korshinskia*. Isotype of the species name must be in LE.

Distribution in MA & K: Kazakhstan (W: Aktobe prov.; NE: E Kazakhstan prov.; Central: Karagandy prov., Kzyl-Orda prov.; S: S Kazakhstan prov., Zhambyl prov.; SE: Almaty prov.), Kyrgyzstan (Jalal-Abad prov., Chüh prov.), Tadzhikistan (Soghd prov.), Uzbekistan (Kara-kalpak, Buxoro prov., Navoi prov., Dzhizak prov., Sirdarya prov., Toshkent prov.), Turkmenistan (Lebap prov., Mary prov.).

Distribution in other Asian countries: China, Afghanistan

Distribution area: Central and South-Western Asia.

***Prangos dzhungarica* Pimenov, 1983, in Vvedensky (ed.), Opred. Rast. Sred. Azii 7: 371, 203.**

Type: KAZAKHSTAN. “Prov. Taldy-Kurgan, Montes Dzhungar Alatau, declivum septentrionale, valle fl. Rgaity, declive lapidosum, 29 VI 1974, Pimenov 476” (holotype MW! [MW0593780]; isotypes LE! [LE00051384, LE00051385, LE00051386]).

= *Prangos multicostata* Kljuykov et Lyskov, 2016, Phytotaxa 277(1): 70.

Type: KAZAKHSTAN. “East Kazakhstan province: Urzhar district, vicinity of Kysyl-Bulak village, Tarbagatai Range (S side, valley of Kokterek river, gravelly slope, alt = 830–910 m, 47°00'N, 82°17'E. 01 VI 2010. Maslova & Khrustaleva” (holotype MW! [MW095558, MW0595559]).

Note: Type material of the last species is represented by evidently terate specimen with synflorescence the most probably infected by insects

(probably additional mericarp ribs, not typical for the genus *Prangos*, have the same origin). Difference in length of terminal leaves lobes may be connected with ecological conditions and vegetation in different years. Position *P. multicostata* in subclade of molecular tree together with *P. didyma* and *P. cachroides* (two names of the same species) is in clear incongruence with basic carpological characters of three species. So, the separation of *P. multicostata* seems to be dubious and at least praemature. The isotypes of *P. dzhungarica* in LE are more similar to *P. multicostata* than those in MW.

Distribution in MA & K: Kazakhstan (S: S Kazakhstan prov.), Uzbekistan (Toshkent prov.). Endemic.

Distribution area: South-Western Asia.

Seseli staurophyllum Rech. f. 1940, Repert. Spec. Nov. Regni Veg. 48: 127.

≡ *Eriocycla staurophylla* (Rech. f.) Rech. f., Riedl et Kuber 1964, Anz. Oesterr. Akad. Wiss. Math.-Naturwiss. Kl. 101(1–15): 365.

≡ *Lomatopodium staurophyllum* (Rech. f.) Rech. f. 1987, in Flora Iranica (Rechinger) 162: 349, tab. 281.

Type: IRAN. “Khorassan: in montibus serpentiniacis prope Robat-i Safid inter Mashhad et Torbat-e Hayderi, 1700 m, 10 VII 1937, Rechinger 1510” (lectotype W! [W1951-0011600]; designated by Rechinger (1987: 349), as “typus”; isolectotypes BM [BM000944753], K! [K000697449], NY [NY00406273], US! [US00127231]).

= *Seseli jomiticum* Schischk. 1950, Bot. Mater. Gerb. Bot. Inst. Komarova Akad. Nauk SSSR 13: 163.

Type: TURKMENISTAN. “Asia Media, Turcomania, in alveo sicco rivi montani ad stationem viae ferreae Achcza-Kujma, 21 X 1915, *Androssov 1578*” (holotype LE! [LE01065966]).

Distribution in MA & K: Kazakhstan (W: Aktobe prov., Mangystau prov.), Uzbekistan (Karakalpak), Turkmenistan (Balkan prov.).

Distribution in other Asian countries: Iran.

Distribution area: Central and South-Western Asia.

Note: The species is closely related to *S. cuneifolium* M. Bieb. and *S. eriocephalum* (Pall.) B. Fedtsch., forming a complicated taxonomic circle. Their united area is very large – from Eastern Caucasus to Kazakhstan-Chinese border. Although infrapopulational and interpopulational variability is sometimes broad, it is difficult to find any constant differences among long-distant populations. Analysis of nrDNA ITS variation (unpublished data) also does not show any difference among them. *S. staurophyllum* (incl. *S. jomiticum*) seems now to be differing from *S. eriocephalum* in its polycarpic (not monocarpic) life-form.

Seseli strictum Ledeb., 1829, Fl. Altaic. (Lebedour) 1: 338.

≡ *Athamanta stricta* (Ledeb.) Ledeb., 1840, in Nomencl. Bot. (Steudel), ed. 2, 1: 166.

Type: RUSSIA/KAZAKHSTAN. “In pratinibus ad radices montium altaicorum frequens v. gr. prope Sogra, Loktewsk, Smejow alibique (*Lebedour & Meyer*); [Loktewsk], *Lebedour & Meyer 257*” (lectotype LE!, designated as “typus” by Pimenov (1978: 197); isolectotypes C! [C10008566?], P! [P02496631]; “Altai, Sogra, 24 VIII 1826, *Lebedour 1151*” (syntype LE! [LE01066013]).

= *Pseudammi ehrenbergii* H. Wolff, 1920, Repert. Spec. Nov. Regni Veg. 17: 173.

= *Ammi ehrenbergii* (H. Wolff) M. Hiroe, 1979, Umbelliferae World: 1025.

Type: RUSSIA. “Sibiria occidentalis: inter Omsk et Petropavlovsk, 1929, *Ehrenberg*” (syntype); “Altai: loco et tempore non indicates, *Ehrenberg*” (syntype).

Distribution in MA & K: Kazakhstan (W: Aktobe prov.; N: Kostonai prov., Akmola prov., N Kazakhstan prov., Pavlodar prov.; NE: E Kazakhstan prov.; Central: Karagandy prov.; S: Dzhambyl prov.).

Distribution in other Asian countries: Russia, China.

Distribution area: Asia (Northern and Central), Europa (E).

Seseli talassicum (Korovin) Pimenov et Sdobnina, 1975, Bot. Zhurn. (Leningrad) 60(8): 1118.

Distribution in other Asian countries: China.

Distribution area: Central & South-Western Asia.

Conclusion

Umbelliferae biodiversity within the borders of Middle Asia and Kazakhstan can be characterized by the following numbers. In the overall territory of Kazakhstan, Kyrgyzstan, Tajikistan, Uzbekistan and Turkmenistan, 107 genera/459 species/204 endemic species of the Umbelliferae, have currently been registered. 82 genera/211 species/28 endemic species are distributed in Kazakhstan, 68 genera/200 species/18 endemic species in Uzbekistan, 65 genera/ 192 species/29 endemic species in Kyrgyzstan, 65 genera/176 species/20 endemic species in Tajikistan, and 51 genera/122 species/9 endemic species in Turkmenistan. Despite some difference in numbers, three states of mountainous Middle Asia (Uzbekistan, Kyrgyzstan and Tajikistan) plus Kazakhstan, the southern part of which geographically and floristically forms one phytochorion with these three republics are similar in their sets of Umbelliferae biodiversity, whereas Turkmenistan is considerably different. Only its smaller part, i.e., the western slope of the Kuhitang Range, could be regarded within mountainous Middle Asia.

Similar relationships are revealed if one compares the lists of five biggest Umbelliferae genera by country: In each of them, the genus *Ferula* will come

first, with 48 species in Kazakhstan, 47 species in Uzbekistan, 41 species in Tadzhikistan, 37 species in Kyrgyzstan, and only 19 species in Turkmenistan. The genus *Seseli* is the second in Kazakhstan (29 sp.), Kyrgyzstan (23 sp.), Uzbekistan (20 sp.), and Tajikistan (13 sp.), but not in Turkmenistan, where *Elwendia* is the second (11 sp.). Interestingly, the next three genera – turn out to be different: *Schrenkia-Bupleurum-Aulasospermum* in Kazakhstan, *Bupleurum – Elaeosticta – Aulacospermum* in Kyrgyzstan, *Elwendia – Elaeosticta – Prangos* in Uzbekistan, *Elaeosticta – Semenovia – Elwendia* in Tajikistan, and *Elaeosticta – Dorema – Pimpinella* in Turkmenistan.

The distribution of Umbelliferae specific diversity across the five states' provinces is uneven.

In **Kazakhstan**, the number of species of the family in southern and eastern, largely mountainous, provinces is much higher than in its western and central part, that is mainly flat or with low-mountains. Thus, in the region of W Kazakhstan there are 30 species of Umbelliferae in Western Kazakhstan province, 12 species – in Atyrau, 46 species in Aktobe, and 17 species in Mangystau. Similar low numbers are characteristic of N Kazakhstan: 27 species in North-Kazakhstan province, 37 species in Kostonai, 27 species in Pavlodar, and 42 species in Akmola. Central Kazakhstan occupies an intermediate position, with rather poor Kzyl-Orda province (35 species) and richer, enormous, and predominantly low-mountainous Karagangy province (69 species). Largely mountainous provinces of South-Eastern and Southern Kazakhstan, floristically forming part of Mountainous Middle Asia are characterized by a predictably high biodiversity in Umbelliferae (South-Kazakhstan province – 123 species, Zhambyl province – 105 species, Almaty province – 90 species). There were 89 species registered in NE Kazakhstan, including those not distributed in other Kazakhstan provinces. Among these differential species there are northern (boreal) elements, common with Siberian flora, Central-Asian plants, shared with adjacent the Chinese Xinjiang-Uygur Autonomous Region, and some truly Middle-Asian species, reaching their northern border of distribution on the southern slope of the Tarbagatai Ridge.

Endemic genera (2): *Karatavia* Pimenov & Lavrova, *Tschulaktavia* Bajtenov ex Pimenov et Kljuykov

Endemic species (28): *Autumnalia botschantzevii*, *Dorema karataviense*, *Eryngium karatavicum*, *Ferula glaberrima*, *F. gypsacea*,

F. leucographa, *F. malacophylla*, *F. pachyphylla*, *F. sugatensis*, *F. taukumica*, *F. xeromorpha*, *Hyalolaena tschuiensis*, *Karatavia kultiassivii*, *Ledebouriella seseloides*, *Pachypleurum altaicum*, *Pilopleura goloskokovii*, *Prangos dzhungarica*, *P. equisetoides*, *P. lachnantha*, *Schrenkia congesta*, *S. involucrata*, *S. kultiassovii*, *S. papillaris*, *Schtschurowskia margaritae*, *Seseli betpakdalense*, *S. mironovii*, *Sphaenolobium korovinii*, *Tschulaktavia saxatilis*.

In 7 provinces of **Kyrgyzstan**, the difference in the number of Umbelliferae species is not as significant as in Kazakhstan. This is mainly due to the fact that they are all mountainous, with the largest peaks exceeding 4000 m. At the same time, in most provinces there are foothills and even plains. Only Ysyk-köl and Naryn provinces are fully mid-mountainous and highland regions. Their flora is not so rich as in remaining provinces (Ysyk-köl prov. – 49 species of Umbelliferae and Naryn prov – 50 species, against 122 species in Jalal-Abad prov, 97 species in Osh prov., and 94 species in Batken prov. It should be noted also that florists include significant eastern parts of Ysyk-köl and Naryn provinces into the Central Asian phytocorion the poorest one in Umbelliferae diversity. Chüh and Talas provinces, with 70 and 64 Umbelliferae species respectively, occupy an intermediate position.

Endemic species (29): *Aulacospermum alaicum*, *A. gracile*, *A. plicatum*, *A. tenuisectum*, *Bupleurum ferganense*, *B. isfairamicum*, *Elwendia sary-cheleki*, *Ferula alaica*, *F. czatkalensis*, *F. fedoroviorum*, *F. ferganensis*, *F. inciso-serrata*, *F. pimenovii*, *F. subtilis*, *Mogoltavia narynensis*, *Paulita alaica*, *Schrenkia alaica*, *S. hebecarpa*, *S. pulverulenta*, *Semenovia alaica*, *S. vaginata*, *Seseli alaicum*, *S. eryngioides*, *S. galioides*, *S. giganteum*, *S. kaschgaricum*, *S. korshinskyi*, *S. luteolum*, *S. tenellum*.

A similar situation exists in **Tajikistan** that currently includes four administrative-territorial subdivisions, whose names and borders changed repeatedly in the past. Three of them are Kühistani Badakhshan (an autonomous province), Sughd, and Khatlon province; the rest of the territory is called “regions of republican subordination” and is here designated as “Dushanbe prov.” for short. The number of Umbelliferae species per province differs, but not as sharply as in some other countries of the region. Maximal Umbelliferae diversity was registered for Sughd province – 129 species. This can be accounted for by the fact that the area includes very different territories, both in terms of their present

natural condition and geological history – from the arid lowlands of Mogoltau Mts. that make up the Western Tian Shan system, to the highest mountains of Kuhistan, the outskirts of Pamiro-Alai. Slightly inferior to this province of Umbelliferae diversity is Dushanbe prov. (102 species) which shares many species with the above-mentioned Sughd province. Lying even further south, Khatlon province also has a fairly diverse set of the family species (83). Finally, Kühistani Badakhshan consists of two naturally different parts, i.e., the high-mountainous plateau of Pamirs and Tajik Badakhshan proper; between them lies the floristic border separating Middle and Central Asia. In total, there are 74 species of Umbelliferae in Kühistani Badakhshan, most of which are distributed in the latter’s western part.

Endemic genus: *Kafirnigania*.

Endemic species (20): *Aulacospermum ikonnikovii*, *Bupleurum linczevskii*, *Ferula conocaula*, *F. decurrents*, *F. equisetacea*, *F. eugenii*, *F. hissarica*, *F. linczevskii*, *F. mogoltavica*, *F. seravschanica*, *F. violacea*, *Hyalolaena melanorhiza*, *Kafirnigania hissarica*, *Paulita alpina*, *Semenovia dissectifolia*, *S. furcata*, *S. pulvinata*, *Seseli rimosum*, *S. sclerophyllum*, *Zeravschania scabrifolia*.

Unlike Kyrgyzstan and Tajikistan, 12 provinces of **Uzbekistan**, as well as the Karakalpak Autonomous Republic, are very different in natural conditions, with most of the country being a flat desert (Kyzyl-kum, the eastern part of the Usturt Plateau, etc.) or occupied by irrigated cotton fields and orchards. Umbelliferae biodiversity is concentrated in mountainous areas. There is a well-defined correlation between the province’s relief and the number of Umbelliferae species. The greatest number of species is observed in provinces whose territory boasts the entire altitude profile, from the foothills to the alpine belt. These are primarily Toshkent, Qashqadarya, and Surxondarya provinces with 98, 89, and 87 Umbelliferae species, respectively. Similar data were obtained for Samarqand and Dzhizak provinces (76 and 75 species of the family). At the opposite end of the range are Sirdarya, Andijon, and Khorezm provinces, with 21, 14 and 7 species, respectively.

Endemic genera: *Kuramosciadium*, *Sphaerosciadium*.

Endemic species (19): *Autumnalia innopinata*, *Cephanopodium hissaricum*, *Elwendia angreni*, *Elwendia bucharica*, *Elwendia ugamica*, *Ferula helenae*, *F. kyzylkumica*, *F. nuratavica*, *F. pratovii*, *Galagania neglecta*, *Korshinskia tianschanica*,

Kuramosciadium corydalifolium, *Lomatocarpa multivittata*, *Oenanthe fedtschenkoana*, *Seseli desertorum*, *S. merkolowiczii*, *Spaenolobium tenuisectum*, *Sphaerosciadium denaense*.

Like most of the areas under consideration **Turkmenistan** undoubtedly belongs to the vast phytochorion of South-West Asia, but is closer to Iran in terms of flora. Only a small area bordering Uzbekistan on the western slope of the Kuhitang Range belongs to Mountainous Middle Asia. The diversity of Umbelliferae species is confined primarily to the Kopetdagh and Balchan Ridges (prov. Akhal – 78 species, prov. Balkan – 68 species). Somewhat fewer Umbelliferae species are registered in prov. Lepab (52 species), which includes parts of Kuhitang Ridge, and in prov. Mary (41 species), with the Badhyz lowlands and the foothills of the Parapamiz Ridge in Afghanistan. Desert prov. Daşoguz differs from the above mentioned by the lowest number of known Umbelliferae species (8).

Endemic species (9): *Dorema balchanorum*, *Elaeosticta korovinii*, *E. platyphylla*, *Elwendia kopetdagensis*, *Ferula plurivittata*, *Galagania margiana*, *Hyalolaena transcasica*, *Pimpinella bobrovii*, *Zeravschania kopetdagensis*.

The biggest genera in the Umbelliferae of Middle Asian & Kazakhstanian flora are *Ferula* (100 species), *Seseli* (49 species), *Bupleurum*, *Elaeosticta* & *Elwendia* (all with 18 species each), *Prangos* (17 species), *Semenovia* (16 species), *Aulacospermum*

& *Schrenkia* (each with 13 species), and *Hyalolaena* (10 species).

16 genera are endemic to Middle Asia and Kazakhstan – *Astomatopsis*, *Autumnalia*, *Fergania*, *Kafirnigania*, *Karatavia*, *Komarovia*, *Kuramosciadium*, *Lipskya*, *Mogoltavia*, *Paulita*, *Pilopleura*, *Schtschurowskia*, *Sclerotiaria*, *Spaenolobium*, *Sphaerosciadium*, and *Tschulak-tavia*. The following 6 genera can be classified as subendemics – *Ledebouriella*, *Mediasia*, *Oedibasis*, *Ormopterum*, *Pastinacopsis*, and *Schrenkia*.

Acknowledgements

We are grateful to the curators of LE (prof. D. V. Geltman) and TASH (prof. K. Sh. Tojibaev), as well as to staff of LE, MW, P, TASH, W and other mentioned herbaria for use of their facilities. Author is thankful to Dr. Alexander Sennikov (Helsinki) and the redactor of the article Dr. Dmitry German (Barnaul) for their valuable comments in complicated cases of botanical nomenclature.

Funding

The work is supported by the Russian Foundation of Basic Research (grant 19-04-00370).
